		compressor is starting. If the tension decreases while the compressor is humming, but it doesn't start, the failure is to charge to the insufficient feeding line section; in this case, replace the feeding line with one of suitable section.
	10.2 Electrical feeding with lower tension than tolerance limits.	**10.3.1** Connect a refrigerant recovery unit in a circuit point, where there is only liquid refrigerant and recover the excess, start therefore the compressor and verify the working pressures.
	10.3 Excessive refrigerant charge.	**10.4.1** Replace the relay with one new.
	10.4 Defective or not suitable starting relay.	**10.5.1** Through a provisional electrical connection, going to the compressor electrical motor an impulse that makes it rotate in a direction contrary to the previous. In case the tentative has not positive result, repair or replace the compressor.
	10.5 Compressor mechanical lock.	**10.6.1** Disconnect the compressor from the electrical feeding net, remove the conductors from the terminal box and, through an ohmmeter, verify if the wiring strength values are correct. Repair or replace the compressor if necessary.
	10.6 Defective electrical motor wiring.	**10.6.2** Verify the compressor dielectrical rigidity (insulation towards earth). Repair or replace the compresor if necessary.
	10.7 Defective protection device.	**10.7.1** Measure values of start, run currents and of the compressor temperature. If the measured values shows compressor overloads and overheating absence: - for three phase compressors verify the thermistor chain continuity and strength - for single phase compressors verify that at ambient temperature, the electrothermic protector is closed.
	10.8 Defective start capacitor or with rating tension lower than the one prescribed.	**10.8.1** Replace the start capacitor.
	10.9 Defective run capacitor.	**10.9.1** Replace the run capacitor.
11. The three phase compressor does not start, hums intermittently and cyclical intervens the protection module (or similar device arranged by installer).	**11.1** Electrical feeding net with tension lower than the tolerance limits.	**11.1.1** Verify the tension of each phase while the compressor is starting. It the tension decreases while the compressor is humming, but it doesn't start, the failure is to charge to the insufficient feeding line section.
	11.2 One of three phases missing.	**11.2.1** Starting from the compressor terminal box and ascending along the feeding line, verify the tension between the three phases. One phase missing can be due to loose clamps, contactor connection wear, interrupted fuse, etc.
	11.3 Defective protection device or wrong calibrated.	**11.3.1** Measure values of start, run currents and of the compressor temperature. If the measured values show compressor overloads and overheating absence, verify the thermistor chain continuity and strength and, if necessary, replace the compressor.
	11.4 Interrupted electrical motor wiring.	**11.4.1** Disconnect the compressor from the electrical feeding net, remove the conductors from the terminal box and, through an ohmmeter, verify if the wiring strength values are correct. Repair or replace the compressor if necessary.
	11.5 Compressor mechanical lock.	**11.5.1** Repair or replace the compressor. **11.6.1** Verify the compressor dielectrical rigidity (insulation towards earth). Repair or replace the compressor if necessary.

Established failure	Cause	Suggested remedy
12. The compressor doesn't start and doesn't hum also if the control panel is regularly feeded.	**11.6** Electrical motor with earthed wiring.	**12.1.1** Verify the electrical feeding line continuity.
	12.1 Electrical feeding line interrupter.	**12.2.1** Replace the thermostat.
	12.2 Discharged thermostat power element.	**12.3.1** Replace the contactor coil.
	12.3 Contactor coil on failure.	**12.4.1** Remove the intervention cause, push therefore the safety valve manual reset botton.
	12.4 Intervention of a safety device with manual reset.	**12.5.1** Verify the compressor electrical motor wiring continuity, repare or replace therefore the compressor.
13. Speed starting relay connection wear.	**12.5** Compressor electrical motor with interrupted wiring.	**13.1.1** Increase the regulating thermostat differential.
	13.1 Excessive compressor cycling.	**13.2.1** Replace the start capacitor.

WARNING

The suggested interventions have to be executed in observance of the safety precautions illustrated on page 4.
For further details or suggestions, please contact FRASCOLD Technical Department.

1. Controlli e operazioni preliminari

Una volta ricevuto il compressore e prima di procedere alla sua installazione, eseguire alcune semplici operazioni allo scopo di verificarne la sua integrità e idoneità al montaggio nel circuito frigorifero.

1.1 Controlli e verifiche

a) al momento del ricevimento del compressore, verificare che il suo imballo non abbia subito danni durante il trasporto
b) rimuovere l'imballo del compressore
c) verificare che il compressore non sia danneggiato

N.B. Nel caso venissero riscontrati danni o manomissioni, inviare tempestivamente una segnalazione scritta.

d) verificare che la dotazione di accessori forniti a corredo del compressore sia completa
e) adagiare su un piano orizzontale il compressore e verificare che il livello del lubrificante sia sempre superiore a 3/4 della spia di livello (vedi figura 1)
f) verificare che le caratteristiche elettriche riportate sulla targhetta del compressore siano compatibili con i valori della rete di alimentazione

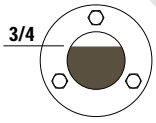

figura 1

1.2 Il sollevamento del compressore

I compressori serie S, V, Z e W sono dotati di una apposita asola di sollevamento posta tra testate e scatola terminale; per il loro sollevamento, utilizzare un cavo di appropriata sezione e gancio infilato dentro l'asola (vedi figura 2).
I compressori serie A, B, D, F e Q sono privi di asola e devono essere sollevati utilizzando una cinghia che avvolge il compressore nella parte mediana (vedi figura 3).
Durante il sollevamento, tenere fermo il compressore per evitare le oscillazioni.

figura 2

figura 3

1. Preliminary checks and operations

After compressor receipt and before its installation, execute some easy operations in order to verify its integrity and fitness for assembly in the refrigerating circuit.

1.1 Checks and testings

a) at compressor receipt, verify that its packing has not been damaged during transport
b) remove compressor packing
c) verify that the compressor is not damaged

N.B. In case damages or tamperings are found, send immediately a written communication.

d) verify that accessories supplied as compressor equipment are complete
e) put the compressor on a horizontal surface and verify that the lubricant level is not lower than 3/4 of level sight glass (see figure 1)
f) verify that the electrical characteristics on the compressor name plate are in accordance with the electrical net values.

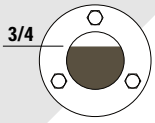

figure 1

1.2 Compressor lifting

Compressors S, V, Z and W series are equipped with a suitable lifting slot placed between the heads and the terminal board.
For their lifting, use a cable with suitable section and hook inside the slot (see figure 2).
Compressors A, B, D and F series are without slot and have to be lifted with a belt, that wraps the compressor in the medial side (see figure 3).
During lifting, keep the compressor still to avoid oscillations.

figure 2

figure 3

2. Installazione del compressore

2.1 Fissaggio del compressore al basamento

È importante che il compressore venga fissato a un basamento perfettamente orizzontale che, oltre a garantire un funzionamento privo di anomale sollecitazioni, è indispensabile per la perfetta lubrificazione delle parti in movimento.
L'impiego dei supporti antivibranti forniti a corredo, impedisce che le vibrazioni che si manifestano durante il funzionamento, l'arresto e l'avviamento del compressore, vengano trasmesse al basamento sul quale lo stesso è montato.

a) allestire il posto di installazione del compressore rispettando gli spazi tecnici necessari così come indicato nei disegni riportati nei cataloghi e nel manuale di installazione
b) mediante i quattro supporti antivibranti forniti a corredo, fissare il compressore al posto di installazione, applicando alle viti la coppia di serraggio qui di seguito riportata

Supporti antivibranti - coppia di serraggio dei dadi

dimensioni del dado		M8	M10
serraggio	Nm	20	30

2.2 Collegamenti frigoriferi

⚠ ATTENZIONE

Prima di rimuovere qualsiasi bullone o rubinetto del compressore, eliminare la carica di tenuta allentando lentamente il dado cieco del rubinetto di compressione.

La realizzazione dei collegamenti frigoriferi del compressore richiede interventi di brasatura dei rubinetti di aspirazione e di compressione.
La affidabilità di un circuito frigorifero è condizionata dalla quantità di prodotti estranei al lubrificante e al refrigerante presenti all'interno del circuito stesso.
Mentre aria atmosferica e umidità (inevitabilmente infiltrati durante il montaggio) possono essere rimossi attraverso la vuotatura, l'estrazione dei residui del disossidante e gli ossidi che si formano durante la brasatura è una operazione nè semplice nè economica.
Le dimensioni delle impurità sono talmente ridotte da sfuggire in parte alla azione dei filtri installati sulla linea del liquido; durante l'assemblaggio del circuito frigorifero, è consigliabile adottare tutte le precauzioni possibili atte a evitare l'introduzione di impurità.
Oltre alle elementari precauzioni da mettere in atto durante il taglio del tubo, è necessario evitare un uso esagerato di disossidanti e, quando possibile, immettere azoto secco o altro

2. Compressor installation

2.1 Compressor fixing to frame

It is important that the compressor is fixed to a frame perfectly horizontal that, besides to guarantee a working without anomalous stresses, is indispensable for the perfect lubrication of parts in motion.
The use of the supplied vibration absorbers avoid that the compressor vibrations during the work, the stop and the start are transmitted to the frame on which the compressor is assembled.

a) prepare the compressor installation seat, respecting the necessary technical spaced as indicated on drawings included in the catalogues and installation manual
b) through the four vibration absorbers supplied as equipment, fix the compressor on installation seat, applying the correct tightening torque, as below

Vibration absorbers - bolt tightening torque

bolt dimension		M8	M10
tightening torque	Nm	20	30

⚠ WARNING

Before removing any compressor bolt or valve, discharge the holding charge by opening slowly the suction valve plug.

The compressor refrigerating connections realization require suction and discharge valve brazing operations.
The refrigeration system's reliability will be reduced if foreign particles are allowed into the circuit.
While atmospherical air and humidity (infiltrated inevitably during assembly) can be removed through vacuum, the removal of the deoxidizer and oxide residual, which develops during brazing, is an operation neither simple nor cheap.
The impurity dimensions are so small to bypass partly the action of filters installed in liquid lines; during refrigerating circuit assembly, it is advisable to use all possible precautions in order to avoid impurity introduction.
Besides to elementary precautions to take during pipe cutting, it is necessary to avoid an excessive use of deoxidizers and, when possible, to put dry nitrogen or other inert gas in the piping during its brazing; to avoid to offer valve internal parts at a dangerous overheating, it is suggested to disassemble the valve or only the coupling (by removing the gaskets) and wrap it in a wet cloth.

gas inerte nella tubazione durante la sua brasatura; per evitare di esporre le parti interne del rubinetto a un pericoloso surriscaldamento, si consiglia di smontare il rubinetto o il solo manicotto (rimuovendone le guarnizioni) e avvolgerlo in un panno bagnato.

a) allentare lentamente il dado cieco situato sul rubinetto di compressione del compressore e lasciare sfiatare la carica di tenuta di azoto
b) serrare accuratamente il tappo
c) smontare i rubinetti (o il manicotto) dal compressore e rimuovere le guarnizioni
d) procedere alla brasatura dei rubinetti alle tubazioni di scarico e aspirazione del circuito frigorifero, adottando le precauzioni necessarie ad evitare sia il surriscaldamento delle parti interne che l'introduzione di prodotti estranei
e) sostituire le guarnizioni precedentemente rimosse con quelle fornite a corredo poste all'interno della scatola terminale
f) rimontare i rubinetti (o il manicotto) applicando alle viti la coppia di serraggio qui di seguito riportata

Rubinetti - coppia di serraggio delle viti

dimensioni della vite		M8	M10	M12
serraggio	Nm	35	50	67

Prima di procedere nelle operazioni di installazione, si consiglia di predisporre il compressore per il collegamento dei dispositivi di sicurezza e controllo quali pressostati e manometri oppure per gli interventi di reintegro della carica di olio.
Il corpo del compressore è dotato di diversi attacchi filettati femmina con tappo di chiusura; la rimozione di alcuni tappi e la loro sostituzione con semplici nipli, metterà a disposizione dell'operatore le necessarie prese di pressione per i collegamenti ai vari dispositivi di sicurezza e controllo (vedi "Istruzioni per la installazione e l'avviamento" pagina 8).

⚠ ATTENZIONE

Non collegare alcun dispositivo di sicurezza e controllo agli attacchi presenti sui rubinetti di aspirazione e di compressione; questi vengono esclusi quando il rubinetto è completamente aperto (intercettazione in retrochiusura).

Per la scelta e il montaggio di equipaggiamenti secondari e/o accessori quali pressostati, termostati, manometri, separatore di olio, etc. si consiglia di prendere visione di quanto riportato nel manuale di installazione a pagina 11, "7. Accessori vari".

2.3 Collegamenti elettrici

I collegamenti elettrici devono essere eseguiti in accordo con gli schemi elettrici allegati al presente manuale e nel rispetto delle norme di sicurezza in vigore nel luogo di installazione.
Per il corretto collegamento del compressore, consultare lo schema elettrico applicato nella parte interna del coperchio della scatola terminali oppure lo schema elettrico riportato nel manuale di installazione.

⚠ ATTENZIONE

I collegamenti elettrici devono essere eseguiti esclusivamente da personale specializzato.

a) rimuovere il coperchio della scatola terminali
b) svitare i dadi; posizionare le barrette a ponticello seguendo le indicazioni

⚠ ATTENZIONE

L'errato collegamento elettrico può dare luogo a cortocorcuiti o collegamenti in contro fase e causa la bruciatura del motore.

c) inserire negli appositi fori della scatola terminali degli idonei pressacavi PG per assicurare il grado di protezione originale della scatola stessa
d) collegare la rete di alimentazione alla morsettiera utilizzando idoneo cavo elettrico isolato e capicorda ad occhiello adatti ai terminali
e) applicare ai dadi la coppia di serraggio qui di seguito riportata

Scatola terminali - coppia di serraggio dei dadi

dimensioni del dado		M4	M6
serraggio	Nm	5	10

f) rimuovere il coperchio del dispositivo di protezione
g) collegare il dispositivo al circuito elettrico di controllo seguendo quanto indicato nello schema elettrico e rimontare il coperchio sulla scatola terminali

⚠ ATTENZIONE

Non alimentare direttamente i terminali A e B collegati ai termistori PTC.

N.B. Se il compressore è dotato di riscaldatore olio carter, quest'ultimo deve essere collegato in modo da poter essere alimentato manualmente almeno 2 ore prima dell'avviamento successivo a un lungo periodo di inattività e, durante il normale funzionamento, solo a compressore fermo.

2.4 Selezione del teleruttore, dei fusibili e dei cavi

La selezione di idonei teleruttori, fusibili e cavi, deve soddisfare quanto richiesto dalla norma EN60204 (Equipaggiamenti elettrici per macchine industriali - Requisiti generali) facendo riferimento ai valori di massima corrente di funzionamento MRA riportati sulla targhetta del compressore e di massima potenza assorbita.
N.B. La potenza nominale del compressore non è equivalente alla potenza massima del suo motore elettrico.

Per informazioni più dettagliate, richiedere il manuale: "**FTEC01 - Istruzioni per la installazione e l'avviamento**".

a) open slowly the compressor suction valve plug and let off the nitrogen holding charge
b) close carefully the plug
c) disassemble the valves (or the coupling) from compressor
d) remove the gaskets
e) effect the brazing of the valves of the discharge and suction pipes of the refrigerating circuit, taking the necessary precautions to avoid both internal part overheating and foreign product introduction
f) replace the gaskets previously removed, with those supplied as spares placed inside the terminal box
g) re-assemble the valves (or the coupling), applying the following tightening torque

Valves - bolt tightening torque

bolt dimensions		M8	M10	M12
tightening torque	Nm	35	50	67

Before proceeding to installation operations, it is suggested to arrange the compressor for safety and check devices connection, like pressure switches and manometers, or for oil charge fulfilment interventions.
The compressor body is equipped with different female threaded connections with closing plug; the removal of some plugs and their replacement with Schrader service valves or niple, will put at operator's disposal the necessary pressure connections for various safety and check devices (see "Installation and start-up instructions" page 8).

⚠ WARNING

Do not connect any safety and check device to the connections placed on suction and discharge valves, because they are closed off when the valve is completely open (interception in retroclosing).

For the choice and assembly of secondary equipments and/or accessories like pressure switches, thermostats, manometers, oil separators, etc. it is suggested to look up the installation manual at paragraph "7. Various accessories" on page 11.

2.3 Electrical connections

Electrical connections have to be executed in accordance with the electrical schemes enclosed to the present manual and in observance of installation place safety regulations.
For the right compressor connection, look at the electrical scheme placed in the inside of terminal box cover or the electrical scheme shown on installation manual.

⚠ WARNING

Electrical connections have to be executed only by skilled operator.

a) remove the terminal box cover
b) unscrew the nuts and place the staple bars following the indications

⚠ WARNING

The incorrect electrical connections may cause short circuit or counter phase connections and therefore the motor burn-out.

c) put in the terminal box holes some suitable PG cable-presses to assure the box's original protection grade
d) connect the feeding net to the teminal box, using suitable insulated electrical cable and eyelet cable terminals fitted to terminals
e) apply to nuts the following tightening torque

Terminal box - bolt tightening torque

bolt dimensions		M4	M6
tightening torque	Nm	5	10

f) after removing its cover, connect the protection device to check and protection circuit, following the electrical scheme

⚠ WARNING

Do not feed directly terminals A and B connected to PTC thermistors.

g) reassemble the protection device cover and the one of the terminal box

N.B. If the compressor is equipped with oil crankcase heater, this has to be connected so that it can be feed manually at least 2 hours before starting after a long period of inactivity and, during the normal working, only with not running compressor.

2.4 Contactor, fuse and cable selection

The suitable remote control switch, fuse and cable selection has to satisfy what requested from EN60204 regulation (Electrical equipments for industrial machines - General requirements), with reference to MRA maximum operating current values reported on the compressor name plate and maximum input power.
N.B. The compressor nominal power is not equivalent to the maximum input power of its electrical motor.

For more detailed informations, please request the manual: "**FTEC01 - Installation and start-up instructions**".

Controller

System 350™ A350P Electronic Proportional Plus Integral Temperature Control

The A350P is an electronic, proportional plus integral temperature control with analog 0 to 10 VDC and 0 to 20 mA outputs. The control is equipped with three user-selectable time integration constants and an adjustable throttling range of 2 to 30F° (1 to 17C°). Two models cover a setpoint range of -30 to 130°F (-35 to 55°C) and 90 to 250°F (32 to 121°C).

As are all System 350 products, the A350P control is housed in a NEMA 1, high-impact plastic enclosure. The modular design provides easy, plug-together connections for quick installation and future expandability.

Figure 1: A350P Electronic Proportional Plus Integral Temperature Control

Features and Benefits

❑ **Modular Design**	Enables stage, display, and power modules to be purchased and installed as needed
❑ **Plug-Together Connectors and 35 mm DIN Rail Mounting**	Eliminates wiring between modules, which reduces installation costs
❑ **Two Models Cover a Wide Setpoint Range of -30 to 250°F (-35 to 121°C)**	Reduces inventory by encompassing temperature ranges required to support the majority of Heating, Ventilation, Air Conditioning, and Refrigeration (HVAC/R) applications
❑ **Minimum Output Adjustable from 0 to 60%**	Tailors the output to the requirements of the controlled device; can be used to set minimum valve or damper position
❑ **Adjustable Throttling Range of 2 to 30F° (1 to 17C°)**	Enables the user to tune the system for optimum stable performance
❑ **Field-selectable Reverse or Direct Acting Mode**	Works in heating or cooling applications
❑ **Three User-Selectable Integration Time Constants**	Provides selection of the integration constant for applications requiring proportional plus integral control
❑ **Interchangeable Temperature Sensors**	Increase versatility and serviceability

© 1999 Johnson Controls, Inc.
Part No. 24-7664-192, Rev. F
Code No. LIT-930020

Application

The A350P Temperature Control can be used as a standalone device or in conjunction with plug-together accessory modules. The addition of S350 Stage Modules allows for the control of multiple stage HVAC/R applications. Typical application for the A350P includes:

- proportional heating control with staged direct expansion cooling
- simple temperature control for air handling units
- modulating damper actuators for mixed air control
- simple proportional mixed air control

A typical System 350 Temperature Control setup includes the following:

- A350P Temperature Control
- A99B Series Temperature Sensor
- Y350R Power Module (or 24 VAC Class 2 transformer)
- S350 Stage Modules
- D350 Digital Temperature Display Module

Operation

The A350P control operates on 24 VAC/VDC and provides two simultaneous analog outputs: 0 to 10 VDC and 0 to 20 mA. A cover-mounted, 10-segment Light-Emitting Diode (LED) bar graph indicates percentage of output.

Features include:

- adjustable setpoint
- adjustable minimum output
- adjustable throttling range (proportional band)
- selectable integration time constant
- selectable Reverse Acting (RA) or Direct Acting (DA) mode of operation

IMPORTANT:	All System 350 controls are designed for use **only** as operating controls. Where an operating control failure would result in personal injury and/or loss of property, it is the responsibility of the installer to add devices (safety, limit controls) or systems (alarm, supervisory systems) that protect against, or warn of, control failure.

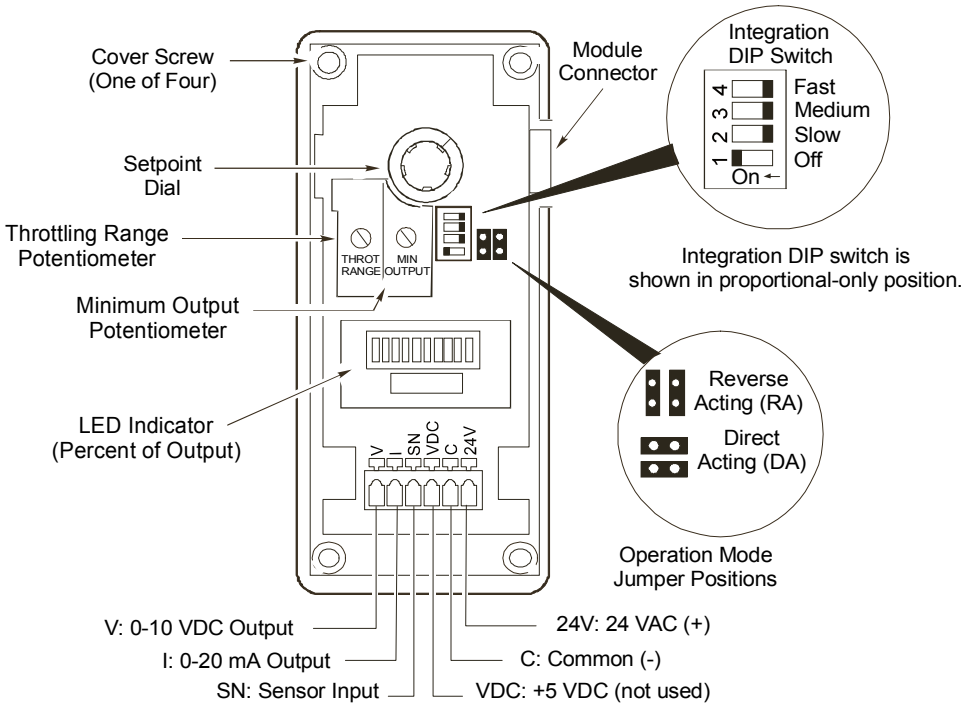

Figure 2: Interior View Showing A350P Control s Features

Minimum Output Adjustment

The minimum output adjustment sets the minimum voltage or milliampere output provided by the A350P control. It can be adjusted from 0 to 60% (0 to 6 VDC or 0 to 12 mA) of the output range.

Example:

A controlled device responding to a 4-20 mA output would require the minimum output to be adjusted to 20% or 4 mA. (See Figure 3.) The minimum output adjustment may also be used to set valves or dampers to minimum positions.

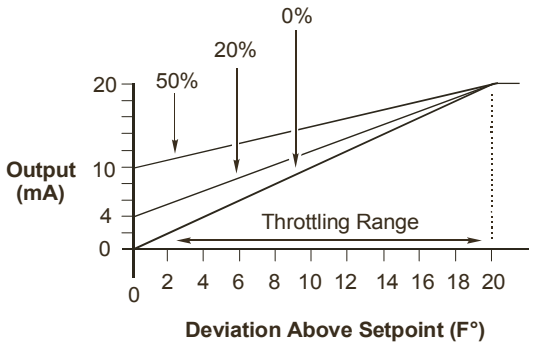

Figure 3: Output vs. Deviation from Setpoint for: Minimum Output = 0, 20, and 50%, Throttling Range = 20°F (DA)

Make the adjustment at the minimum output potentiometer marked as MIN OUTPUT. (See Figure 2.) For each 10% increase in output, the **next** bar on the LED indicator will light (only one bar is lit at any time).

Note: Before setting the minimum output potentiometer, verify that the control reads zero output (that is, no LEDs are lit).

Throttling Range (Proportional Band)

The throttling range is the range over which a control is active. Throttling range for the A350P control can be adjusted from 2 to 30F° (1 to 17C°). Make the adjustment at the throttling range potentiometer marked THROT RANGE (see Figure 2).

Integration Function

Proportional-only controls cannot hold a process at the exact setpoint. A proportional offset is always present because the control output is 0% at setpoint. Any load on the system will cause the control point to be offset from the setpoint. The greater the load on the system, the further the control point will be offset from the setpoint. (This is commonly referred to as proportional offset, and under maximum load this error will approach the throttling range.)

Some proportional-only controls are designed with their setpoint located midway through the proportional band to help compensate for this offset. This results in a plus/minus error from the setpoint rather than a single-ended error. Refer to Figure 4.

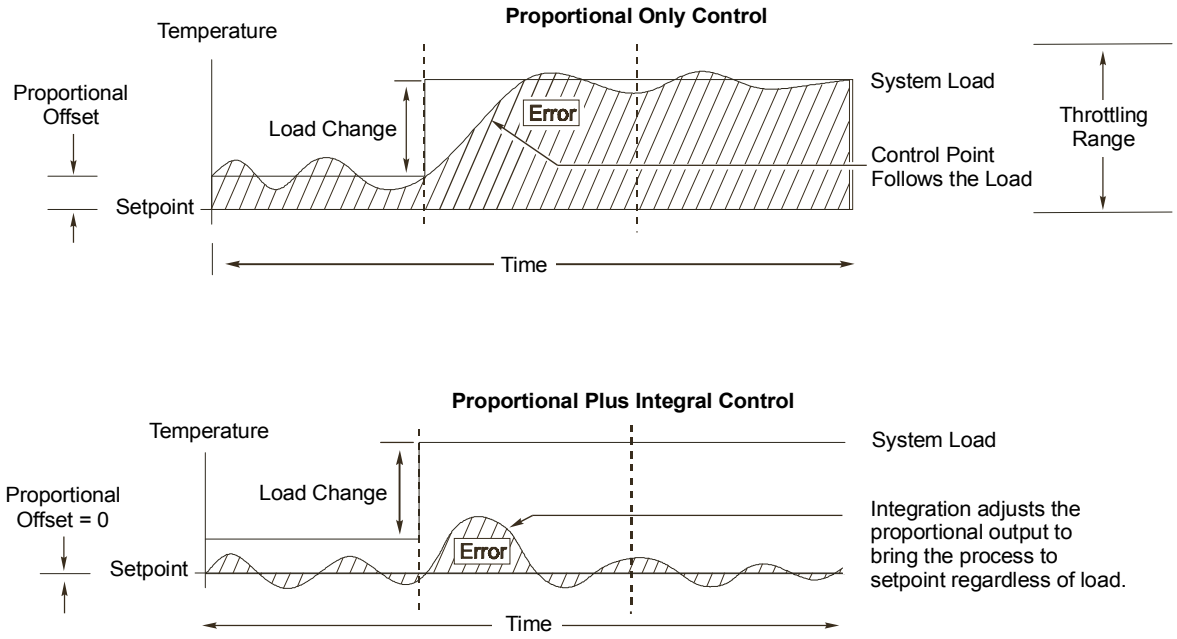

Figure 4: Comparison Between Proportional Only and Proportional Plus Integral Control

The A350P control has an integration feature that forces the control point to match the setpoint. Over time, the A350P will control the heating/cooling equipment to balance the system load at the control setpoint. (See Figure 4.)

On traditional proportional plus integral controls, the amount of correction will become too large if the system load exceeds the capacity of the equipment. When the actuated device (valve or damper) is fully open or closed and the setpoint still cannot be reached, the integration error continues to grow. The result is called *integral windup*.

The A350P control avoids *integral windup* with a patented circuit that puts a dynamic ceiling on the integrator. This resets the integration error when the sensor goes just above the setpoint plus the throttling range (in DA mode) or just below the setpoint minus the throttling range (in RA mode). This allows the process to recover from an out-of-range condition without a large overshoot.

The A350P control has three field-selectable integration constants and an off position. The integration DIP switch selects the integration constant. (See Figure 2 for location.)

The field-selectable integration constants include:

- **OFF: Switch 1 to On position, all others Off** provides proportional-only operation.

Note: In open-loop (without feedback) applications, select OFF (proportional-only) operation.

- **Slow (C3): Switch 2 to On position, all others Off** is the slowest integration constant (26 minute), and is suitable for most proportional plus integral applications. Slow is the recommended initial setting.
- **Medium (C2): Switch 3 to On position, all others Off** selects a 13-minute integration constant. If the rate of system recovery to setpoint is sluggish with the control set to slow, and if the system has enough capacity to drive the process to setpoint at a faster rate, the medium setting may be used.
- **Fast (C1): Switch 4 in On position, all others Off** is the fastest integration constant (6.5 minutes). Use fast only in instances where the rate of change at the sensor is extremely rapid and system capacity can compensate for that rapid change.

Reverse or Direct Acting Operation

With the operation jumpers in the Reverse Acting (RA) position, the analog output increases as the temperature drops below setpoint. (See Figure 5.)

With the operation jumpers in the Direct Acting (DA) position, the analog output will increase as the temperature rises above the setpoint.

Select the RA/DA mode by positioning the operation jumpers vertically or horizontally. (See Figure 2.) Position the operation jumpers vertically for RA and horizontally for DA.

The RA/DA operation jumpers are installed in the RA mode at the factory.

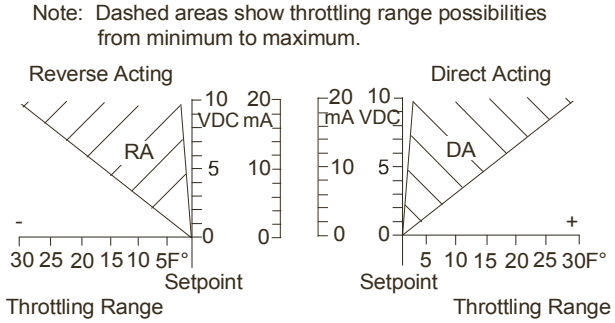

Figure 5: RA and DA Proportional Bands Shown in Proportional-Only Mode

Add-on Modules

The maximum number of add-on modules is listed in Table 1.

Table 1: Maximum Number of S350 Stage Modules per A350P

Power Source	Number of S350A or S350C Stage Modules Allowed	Number of S350A or S350C Modules (with One S350P) Allowed	Number of S350A or S350C Modules (with Two S350Ps) Allowed
Y350R	4	2	0
External Class 2 Transformer	9	8	7

S350A On-Off Stage Modules

S350A On-Off stage modules receive power, setpoint, and sensor input from the A350P control. S350A stage modules perform switching functions based on the control s setpoint and sensor information, as well as the offset and differential selected at the S350A stage module.

For more information on these modules, refer to the *System 350™ S350 Temperature, S351 Humidity, and S352 Pressure On/Off Stage Modules Product/Technical Bulletin (LIT-930080)*.

S350C Slave Stage Module

S350C slave stage modules receive power and sensor input from the A350P control. S350C slave stage modules perform switching functions based upon the control s sensor information, as well as the setpoint and differential selected at the S350C stage module.

For more information on these modules, refer to the *System 350™ S350C Temperature Slave Stage Module Product/Technical Bulletin (LIT-930084)*.

S350P Proportional Stage Modules

S350P proportional stage modules receive power, setpoint, and sensor input from the A350P control. The S350P stage module responds with an analog 0 to 10 VDC and 0 to 20 mA output signal. This is based upon the control s setpoint and sensor information, as well as the offset, throttling range, and minimum output selected at the S350P stage module.

For more information on these modules, refer to the *System 350™ S350P Proportional Plus Integral Temperature Stage Module Product/Technical Bulletin (LIT-930086)*.

Dimensions

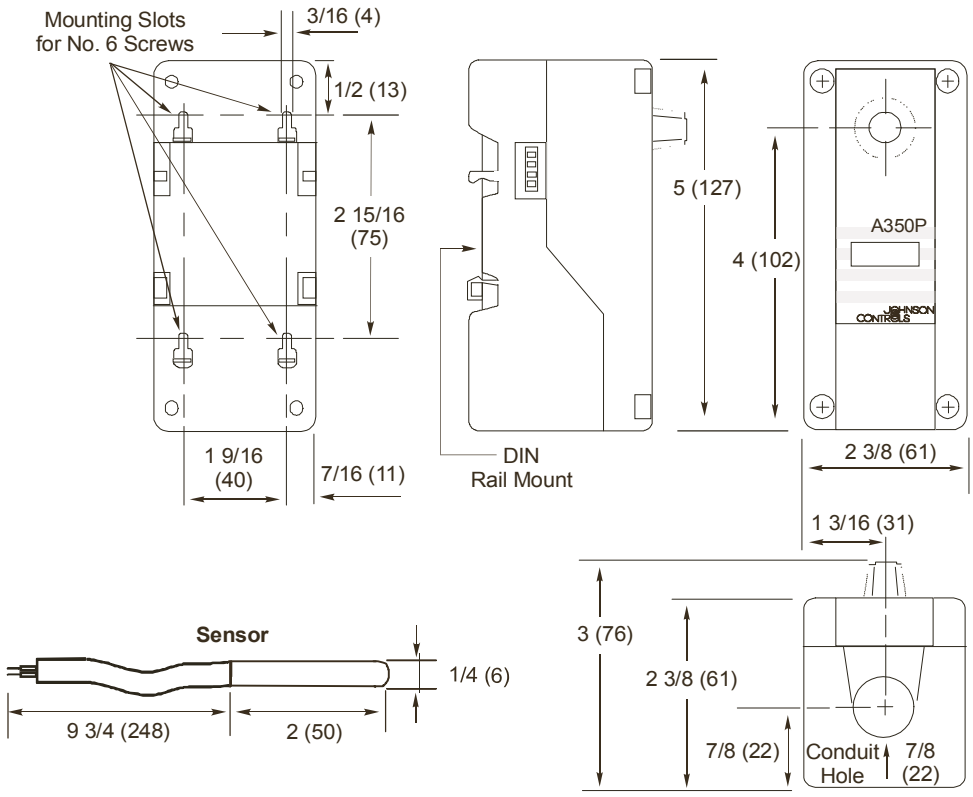

Figure 6: A350P Control and Sensor Dimensions, in. (mm)

Installation and Wiring

Celsius Scale Conversion

A Celsius scale throttling range decal is included with the A350P control. If the Celsius scale is desired:

1. Locate the throttling range and minimum output potentiometers on the main PC board. (See Figure 2.) Carefully remove the knobs and the existing decal.
2. Apply the Celsius scale decal in the same place as the original decal.
3. Rotate both knob stems completely counterclockwise (CCW).
4. Reinstall the potentiometer knobs so the arrows point to the minimum values.

The A350P Temperature Control is housed in a compact NEMA 1 plastic enclosure designed for standard 35 mm DIN rail mounting. Four key-slot mounting holes on the back of the control case are provided should surface mounting be required. If a Y350R is used, it should be mounted immediately to the right of the control. Any S350 modules would follow on the right, with the D350 being the last module mounted, also on the right.

Note: When mounting any System 350 module to rigid conduit, attach the hub to the conduit before securing the hub to the control enclosure.

WARNING: **Risk of Electrical Shock.** Disconnect power supply before making electrical connections to avoid possible electrical shock or equipment damage.

Wiring Terminals

Install all wiring to conform to the National Electrical Code and local regulations. For maximum electrical rating of control, refer to the label inside the control cover. Terminals will accept 12 to 26 AWG wire. Use only copper conductors.

1. Use a 1/8 in. (3 mm) flat-blade screwdriver to push the clamp arm down.
2. Insert the appropriate wire into the opening. Refer to Table 2 for terminal designations.
3. Release the clamp arm to secure the wire. See Figure 7.

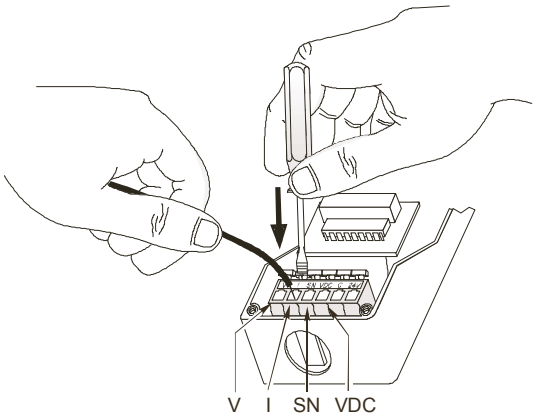

Figure 7: Cage Clamp Terminal Block

Table 2: Terminal Designations

Terminal	Description
V	0 to 10 VDC output
I	0 to 20 mA output
SN	Temperature sensor input
VDC	5 VDC power supply (not used)
C	Common for power supply, temperature sensor, and outputs
24V	24 Volts AC

Note: Output signals from the A350P control vary from 0 to 10 VDC and 0 to 20 mA. (Both outputs can be used simultaneously.) Connections can be made to both the V and I terminals, allowing the control to drive two outputs from the same RA or DA ramp simultaneously. This feature can be used to drive motor actuators of different types in a single application.

Sensor Connection

Shielded cable is not generally required for sensor wiring on runs of less than 50 feet. When using shielded cable, isolate and tape the shield at the sensor. Connect the shield to Terminal C on the A350P control.

Refer to Table 3 for the maximum recommended cable lengths for particular sizes of wire.

Table 3: Maximum Recommended Sensor Cable Lengths

Wire Gauge	Shielded Cable Length	
	Feet	Meters
14 AWG	800	244
16 AWG	500	152
18 AWG	310	94
20 AWG	200	61
22 AWG	124	38

- Various A99B Series Temperature Sensors and mounting hardware are available for use with A350P Series controls.

  The sensor must be connected to Terminals SN and C. (See Figure 2.) The sensors are not polarity sensitive.

- The sensor must be mounted so that it can accurately sense the temperature of the controlled medium.

Table 4: A350P Controls And Sensors

Control	Sensor Included Sensor Lead Length is 9-3/4 in. (0.25 m)
A350PS-1C	A99BB-25C; Range: -40 to 212°F (-40 to 100°C)
A350PS-1CM	A99BB-25C; Range: -40 to 212°F (-40 to 100°C)
A350PS-2C	A99BC-25; Range: -40 to 248°F (-40 to 120°C)
A350PS-2CM	A99BC-25; Range: -40 to 248°F (-40 to 120°C)
A350PT-1C	No Sensor Included
A350BA-2C	A99BC-25; Range: -40 to 248°F (-40 to 120°C)

- For more information regarding sensor options and installation, refer to the *A99B Series Temperature Sensors Product/Technical Bulletin (LIT-125186).*

Adjustments

Follow this procedure to set up the A350P control for the types of operation desired.

1. Remove its cover by loosening the four captive cover screws. (See Figure 2.)
2. Set the RA/DA operation jumpers to the desired mode of operation. Position the operation jumpers vertically for RA (Reverse Acting) or horizontally for DA (Direct Acting). (See Figure 2.)
3. Adjust the throttling range potentiometer to desired setting. Rotate Clockwise (CW) to increase the throttling range.

Notes: Included with the control is a Celsius scale throttling range decal. If the Celsius scale is desired, refer to the *Celsius Scale Conversion* section for decal installation instructions.

If the A350P is to be used in proportional plus integral control, the initial throttling range adjustment is seldom set below 6F° (3C°). A narrow proportional band used in conjunction with the integration may result in unstable control.

4. If minimum output is required, set the minimum output potentiometer (see Figure 2) to the desired position. The 10-segment front LED panel or a voltmeter can be used to read the minimum output. (The minimum setting for the **control** is designated by the 0 on the decal.)

Notes: Before adjusting the minimum output potentiometer, verify that the control reads zero output (that is, no LEDs are lit).

For each 10% increase in output, the **next** bar will light on the LED bar graph (only one bar is lit at anytime). In a milliampere application, each bar equals 2 mA. In a voltage application, each bar equals 1 VDC. (Refer to Figure 3.)

Example:

To set the control for a minimum output of 4 mA, turn the minimum output potentiometer clockwise until the second LED segment just lights.

5. Make sure the system is stable in the proportional mode before selecting integration. Refer to the *Checkout Procedure* section.
6. Reinstall the cover and secure in place with the four captive cover screws.
7. Adjust the setpoint dial to the desired setpoint.

   If using the D350 Display Module, press and hold the setpoint button on the D350 while rotating the setpoint dial.

Note: The control s setpoint is factory calibrated at midscale to a tolerance of ±1F° (0.6C°). The setpoint tolerance at the extreme ends of the setpoint scale may be ± 4F° (2.2C°). The D350 Display Module is unaffected by this tolerance shift. Use the D350 for the most accurate setpoint selection.

Checkout Procedure

Follow this procedure to verify the A350P control is connected and functioning properly.

1. Before applying power, make sure that the installation and wiring connections are according to job specifications.
2. Set up the system for proportional mode (Integration = OFF), and make any necessary adjustments to the setpoint, throttling range, and minimum output. Then select Reverse or Direct Acting mode.
3. After making adjustments and electrical connections, apply power to the system, and observe it for stable operation.
4. If integration is required, select the fast (C1), medium (C2), or slow (C3) integration constant. Slow is the recommended initial setting. (Refer to the *Integration Function* section.)
5. Put the system back into operation. If instability occurs, consider increasing the throttling range.

Troubleshooting

If the control system does not function properly, verify that the proper operation mode is selected on each module (DA or RA), and perform the following procedures to determine the cause of the problem:

1. Check for proper voltages on the A350P control.

   a. Connect a digital voltmeter (DVM) between Terminals 24V (+) and C (-) located on the A350P s terminal block. (See Figure 2.)

      If an external transformer is used, select AC volts on the DVM. Verify that the voltage is between 20 and 30 VAC.

      If a Y350R Power Module is used, select DC volts on the DVM. Verify that the voltage is between 16 and 38 VDC.

      If an external DC power supply is used, select DC volts on the DVM. Verify that the voltage is between 22 and 29 VDC.

   b. If the DVM reading is within the indicated voltage range, select DC volts on the DVM (DVM must be accurate to +/-0.01 VDC), and connect the (+) lead to Terminal VDC and the (-) lead to Terminal C.

      If the DVM voltage is between 4.9 and 5.1 VDC, proceed to Step 2.

      If the DVM voltage is above 5.1 VDC, replace the A350P.

   c. If the DVM voltage is below 4.9 VDC, check the control using the following procedure.

      Disconnect all loads from the A350P control. (If in Direct Acting mode with power on, the system will go to full output when the sensor is disconnected. Thus, ensure that any loads are disconnected *before* disconnecting the temperature sensor.)

      Disconnect the temperature sensor completely, and recheck the DVM voltage.

      If the DVM voltage rises to a value between 4.9 and 5.1 VDC, replace the sensor.

      If the DVM voltage is still below 4.9 VDC, replace the A350P control.

2. Check sensor for proper resistance at a given temperature. (The resistance across the sensor changes with the temperature of the sensor.)

   a. Disconnect power from the A350P control.

   b. Disconnect the sensor from the control and measure the resistance across sensor leads.

   c. When measuring the sensor s resistance, use an accurate thermometer to measure the temperature at the sensor.

   d. Refer to Figure 8 to determine the optimal resistance for the measured temperature.

   e. If the measured resistance varies substantially from the optimal resistance for that temperature, the sensor or wiring must be replaced.

   f. If the sensor s resistance conforms to the chart in Figure 8, reconnect the sensor to the control.

   g. Reconnect power to the control.

Note: The sensor reading indicated by the D350 may differ somewhat from thermometer readings due to sensor tolerances, time constants, thermometer accuracy, and other factors.

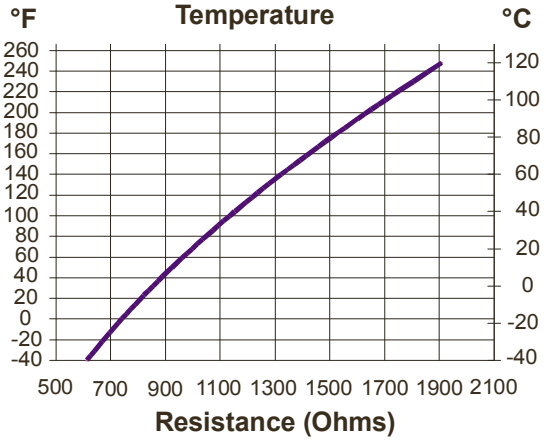

Figure 8: Temperature vs. Resistance Chart for the A99B Series Sensor

3. Check the A350P control for proper operation.

Note: Perform Steps 1 and 2 first.

a. Reconnect the sensor to the control and re-apply power.

b. Turn the throttling range and the minimum output to minimum by turning both potentiometers counterclockwise.

c. Switch off the integration.

d. Select the RA mode.

e. Connect the DVM (+) lead to the A350P control s Terminal SN and the (-) lead to Terminal C.

If the sensor voltage is less than 1.8 VDC on model A350PS-1C or less than 2.3 VDC on model A350PS-2C, go to Step 3g.

f. If the voltage is greater than 1.8 VDC on model A350PS 1C or greater than 2.3 VDC on model A350PS-2C, adjust the setpoint to 120°F (49°C) on model A350PS-1C or 240°F (116°C) on model A350PS-2C.

The output Terminal V should be less than 0.1 VDC, and all LEDs in the bar graph display should be off. If not, replace the A350P.

1. Adjust the minimum output to the maximum by turning the potentiometer CW. As the potentiometer is turned CW, the LEDs in the bar graph should turn on from left to right until the fifth or sixth bar is on. If not, replace the A350P control.

2. Adjust the minimum output to zero again, and select the DA mode.

3. If the right most LED in the bar graph is on (Terminal V = 10 VDC, Terminal I = 20 mA), go to Step 3h. If the LED is not on, replace the A350P.

g. If the sensor voltage is above 1.1 VDC on A350PS-1C or above 1.6 VDC on A350PS-2C, adjust the setpoint to match the actual temperature (T_S). The output Terminal V should be less than 0.1 VDC, and all LEDs in the bar graph should be off.

Note: Some tolerance error is present between the setpoint scale and the setpoint knob pointer. Refer to the *Adjustments* section.

1. Make sure the A350P control is in RA mode.

2. Increase the setpoint in increments of 2F° (1C°).

3. As the setpoint is increased, the control s Terminal V output voltage should go from 0 to 10 VDC, the Terminal I output current should go from 0 to 20 mA, and the LEDs should turn on, one at a time from left to right.

4. If the LEDs do not turn on and if the outputs of terminals V and I do not change as described above, replace the control.

h. Readjust the A350P control to the desired control settings.

Repairs and Replacement

Do not make field repairs or perform calibration. A99B Temperature Sensors and replacement controls are available through the nearest Johnson Controls representative. (See Tables 5 and 6 for ordering information.)

Ordering Information

Table 5: System 350 Products

Item	Product Code Number	Description
A350P Proportional Plus Integral Temperature Controls	A350PS-1C	Range: -30 to 130°F (-35 to 55°C) Throttling Range: 2 to 30 F° (1 to 17C°) (Includes the A99BC-25C Temperature Sensor)
	A350PS-2C	Range: 90 to 250°F (30 to 120°C) Throttling Range: 2 to 30 F° (1 to 17C°) (Includes the A99BC-25C Temperature Sensor)
	A350PT-1C	Range: -30 to 130°F (-35 to 55°C) Throttling Range: 2 to 30F° (1 to 17C°) (Sensor not included)
Display Modules	D350AA-1C D350BA-1C	Digital Temperature Display Module (Fahrenheit Scale) Digital Temperature Display Module (Celsius Scale)
On/Off Stage Modules	S350AA-1C S350AB-1C	Fahrenheit Scale Celsius Scale
Slave Stage Module	S350CC-1C	Dual Scale (°F and °C)
Proportional Stage Module	S350PQ-1C	Dual Scale (°F and °C)
Power Module	Y350R-1C	120 or 240 VAC, 50/60 Hz Input, Rectified Class 2, 24 VAC Output

*WHA29A-600R may be used to daisy chain S350 modules together.

Specifications

Product	A350P Proportional Plus Time Integral Temperature Control	
Supply Voltage	Y350R Power Module:	Input: 120/240 VAC 50/60 Hz
		Output: 24 VDC, unfiltered, 10 VA
	External Source:	24 VAC, 50/60 Hz, Class 2 (20-30 VAC)
	Note: Only one supply voltage source may be used.	
Power Consumption	3.2 VA maximum	
Ambient Temperature	Operating:	-30 to 150°F (-34 to 66°C)
	Shipping:	-40 to 185°F (-40 to 85°C)
Humidity (all modules)	0 to 95% RH non-condensing; maximum dew point 85°F (29°C)	
Setpoint Adjustment Range	A350PS-1C:	-30 to 130°F (-35 to 55°C)
	A350PS-2C:	90 to 250°F (30 to 120°C)
	A350PT-1C:	-30 to 130°F (-35 to 55°C)
Throttling Adjustment Range	2 to 30F° (1 to 17C°)	
Analog Outputs	0 to 10 VDC (550 ohm load minimum) and 0 to 20 mA (600 ohm load maximum)	
Minimum Output	Adjustable from 0 to 60% of the output	
Output Indication	A ten segment LED bar graph indicates percentage of output.	
Control Action	Direct or reverse action is jumper selectable.	
Integration Constant	Four selectable rates: fast, medium, slow, and off	
Sensor	Replaceable positive temperature coefficient sensor	
	Reference resistance 1035 ohms at 77°F (25°C)	
Material	Case and cover:	NEMA 1 high-impact thermoplastic
Agency Listing	UL Listed, CCN XAPX, File E27734	
	UL Listed for Canada, CCN XAPX7, File E27734

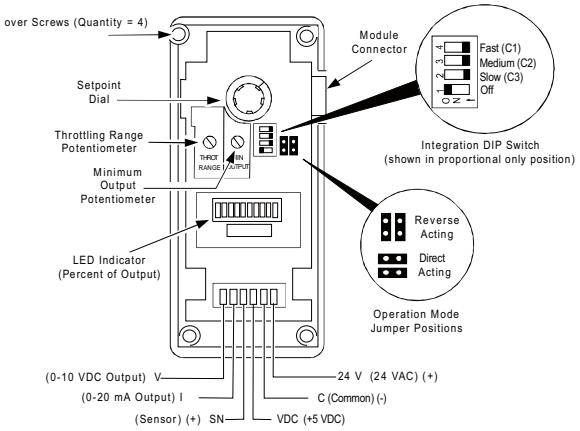
A350P Series

Electronic Proportional Plus Integral Temperature Control

A350P



Features

- field-selectable proportional only or proportional plus integral control
- plug-together connectors and 35 mm DIN rail mounting eliminate wiring between models and reduce installation costs
- ten segment LED displays percent of output signal
- field-selectable reverse or direct-acting mode
- minimum output adjustable from 0 to 60%
- two models cover a wide setpoint range of -30 to 250°F (-35 to 121°C)

Applications

- modulating heating and cooling valves
- maintain mixed air duct temperature via damper modulation

Description

The A350P Electronic Proportional Plus Integral Temperature Control Series has two proportional outputs of 0 to 10 VDC and 0 to 20 mA. This control is used in conjunction with the A99B Series (PTC silicon) Temperature Sensors. Two controls cover a temperature range from -30 to 250°F with an adjustable throttling range (proportional band) of 2 to 30F°.

Proportional plus integral (PI) control is an option to hold setpoint regardless of load shifts on the system. A temperature sensor (A99BC-25C) is included with each A350P control. The S350 Staging Module, D350 Display Module, and Y350R Power Module can be used with the A350P.

To Order

Specify code number from the selection chart, along with additional staging, power and display modules, and temperature sensing enclosures, if required.

Selection Chart

Code Number	Output Signal	Range	Throttling Range	Sensor (Included)
A350PS-1C	Proportional Voltage: 0 to 10 VDC and Proportional Current: 0 to 20 mA	-30 to 130°F -35 to 55°C	2 to 30F° 1 to 17C°	A99BC-25C
A350PT-1C				None
A350PS-2C		90 to 250°F 30 to 121°C		A99BC-25C

Specifications

A350P Electronic Temperature Control with Proportional Output		
Supply Voltage [a]	**Transformer**	20 to 30 VAC, 50/60 Hz, Class 2
	Y350R	120/240 VAC, 50/60 Hz
Proportional Output		0 to 10 VDC (550 ohm load minimum) and 0 to 20 mA. (600 ohm load maximum).
Minimum Output		Adjustable from 0 to 60% of the output span
Output Indication		A ten segment LED indicates percentage of output
Control Action		Direct or reverse action is jumper selectable
Power Consumption		3.2 VA
Integration Constant		Three selectable rates fast, medium, slow and an Off position
Ambient Temperature	**Operating**	-30 to 150°F (-34 to 66°C)
	Shipping	-40 to 185°F (-40 to 85°C)
Humidity		0 to 95% RH non-condensing
Case and Cover Material		NEMA 1, high-impact thermoplastic

(a) Only one voltage source may be used.

Data sheet

ESBE Series 90 Electronic Motor Actuator (Combined with ESBE 3&4-Way Rotary Valves)

Features:

The ESBE 24 volt electronic series of motors are direct mounted actuators that rotate ESBE 3 & 4-way rotary valves for hydronic heating and cooling systems. The Series 90 actuator provides additional torque compared to the Series 60 and ARA series of actuators, and can be installed on all ESBE 3 & 4 way rotary valves, in sizes from ½" – 6" valves. The Series 90 motors also have linkage kits available capable of adapting to Viessmann, Honeywell, Centra DR/ZR, Landis & Staefa and TA VTR styles of valves.

Features:

- ESBE control motor series are of a compact design
- Direct mount actuators
- Easy manual override of motor actuator
- Adjustable rotation between 30° and 180° with internal cams
- Floating 3-point and proportional signal operation
- Several motors with an auxiliary contact switch activated through an adjustable cam

Ordering information:

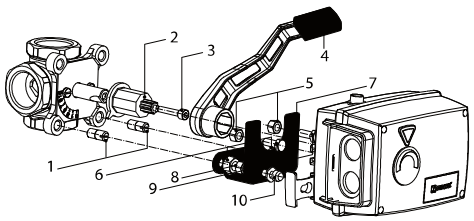
90 Series Actuator: All ESBE rotary mixing valves*

Code No.	Series	Signal	Run Time (90°@60Hz)
065F8952	91EM	Floating 3 point, with Aux. Switch	12 sec.
065F8953	92EM		50 sec.
065F8959	92-2EM		100 sec.
065F8954	93EM		4 min.
065F8955	92P	Proportional	60, 90 or 120 sec.
065F8956	92K2	Built-in Temperature controller	50 sec.

*91EM, valves up to 2" only for diverting application

Replacement Parts ESBE:

90 Series Actuator



Code No.	Description	Item #
25413000	Metal drive sleeve	2
193B1615	Mounting kit for 90 series	1-10
193B1616	Series 90 actuators to ESBE VRG valves	(Not shown)
25430000	Remote Sensor for 92K2 motor	(Not shown)

Applications:

3-way mixing valve application	
	When coupled with a controller the assembly of the 90 Series motor actuator and ESBE rotary valve provide regulation of the fluid through the system.
3-way diverting valve application	
	The self contained 92K2 motor actuator with temperature controller provides constant temperature regulation of system fluid. The adjustability of time in the reading of the sensor, provides flexibility for mixing and diverting applications.
4-way mixing valve application	
	The Series 90 motor actuator provides higher torque capabilities allowing use on larger sized valves requiring up to 135 in. lbs. of torque.

Accessories:

Linkage Kit	Non ESBE Valves
065F8957	Viessmann Valve
065F8958	Centra #900 Valve
065F8990	Landis & Staefa Valve
065F8991	Oventrop Valve
065F8992	TA VTR Valve

3 & 4-way Mixing Valves:

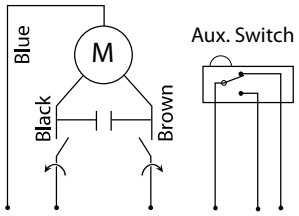
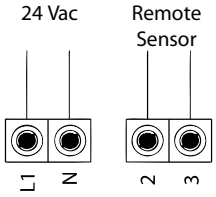
Technical Specifications:

Supply Voltage	24VAC 50/60 Hz, (92P: 24VAC/DC 50/60 Hz)
Power Consumption	91EM / 92EM / 92-2EM / 93EM: 2VA 92P / 92K2: 5VA
Rotation (Factory set)	90°, adjustable b/w 30° and 180° (92P only 90° rotation)
Torque	135 in. lb (15Nm) [91EM: 45 in. lb (5Nm)]
Mountable Valve Styles and Valve Sizes	ESBE rotary mixing valves MG / G / F / VRG styles Valve Sizes ½" to 6", (91EM: Up to 2")
Enclosure	NEMA 13, IP 54
Ambient Temp. Range	5 to 131°F (-15 to 55°C)
Weight	1.8lb (0.8kg)
Signal / Run Time	**3-point floating:** 50 Hz / 60 Hz 91EM: 15 sec. / 12 sec. 92EM: 1 min. / 50 sec. 92-2EM: 2 min. / 100sec. 93EM: 5 min. / 4 min. **Proportional:** (selectable) 92P- Signal: 0-10V, 2-10V, 1-5V, 0-20mA, 4-20mA Run Time: 60, 90 or 120 sec.
Auxiliary Switch	All motors except 92P and 92K2 are with an adjustable cam position, max. 2A
92K2 Set point Controller	Adjustable range: 59° to 158°F (15° to 70°C) Adjustable sensor reading: 1 to 70 sec.

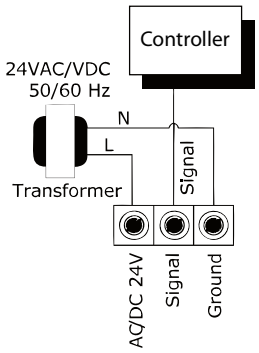
Electrical Wiring:



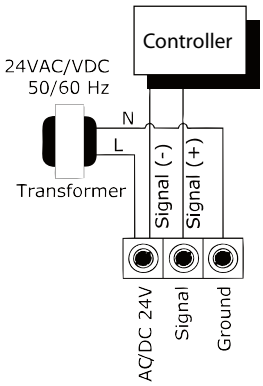
91EM, 92EM,
92-2EM & 93EM Motor



92K2 Motor



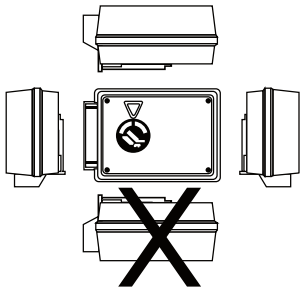
92P Motor
Single Wire Signal

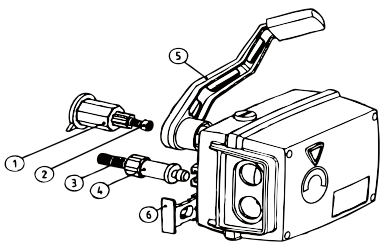


92P Motor
2-Wire Signal

Installation:

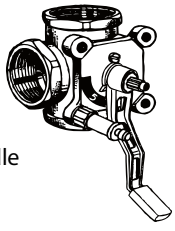
The actuator should be mounted with the valve stem in either a horizontal position or pointing upwards. The actuator should not be installed in a downward orientation.



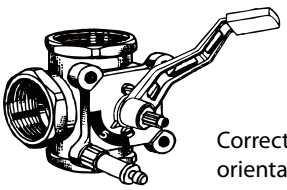


1) Threaded stud
2) Drive sleeve
3) Locking screw
4) Handle
5, 6, 8, 9) Mounting hardware
7) Mounting base

When installing the handle (5), it should be installed opposite to the indicator on the drive sleeve and the end of the handle should be facing away from the valve. Failure to properly install the handle will result in damage to the 90 series motor actuator due to the interference of the mounting stud (4) with the rotation of the handle



Incorrect handle orientation

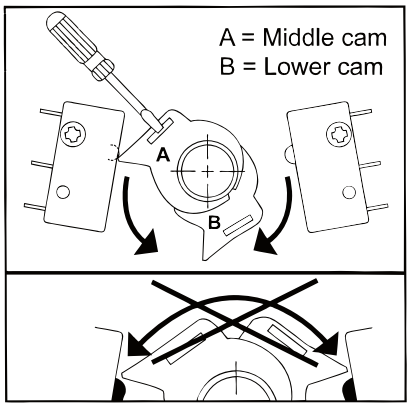


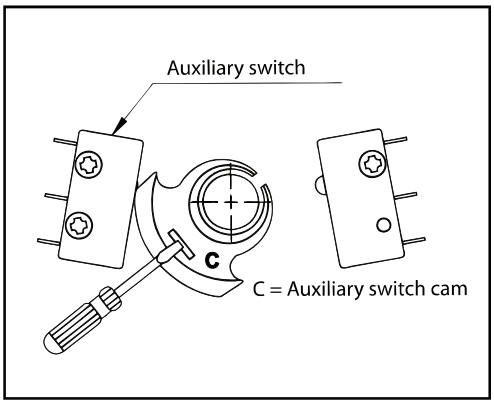
Correct handle orientation

VDKIG122 © Danfoss 02/10

Adjustment of Rotation and Auxiliary Switch Cam:

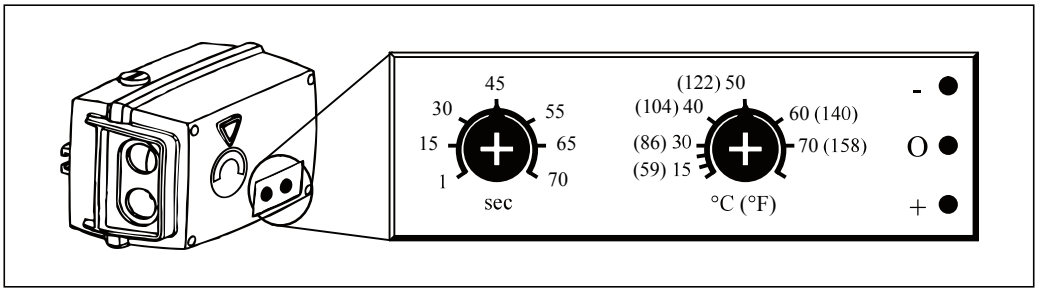
Within the 90 Series motors, the factory set 90°of rotation can be adjustable between 30° and 180°. The adjustment of the angle of rotation and the engagement of the auxiliary switch is set via internal cams within the motor actuator for the 91EM, 92EM, 92-2EM and 93EM. Care should be taken to ensure the cams are engaging the switches properly.



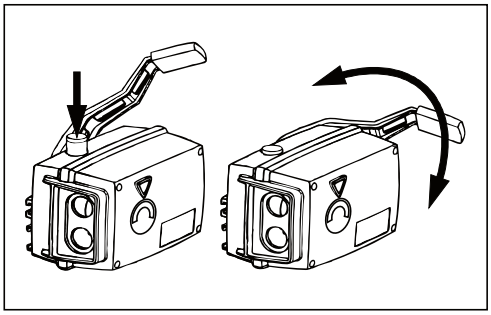


Setting of 92K2 Temperature Controller:

The 92K2 style of electronic motor actuator has a built in set point controller. Included with the actuator is a 6ft remote sensor that can be inserted in a temperature well or pipe mounted. Located on the front of the actuator are two knobs; left knob sets the frequency of time (in seconds) the controller reads the remote sensor, and the right knob is the set point temperature. Setting these two knobs are dependent on the application requirement and how often the controller will take a temperature reading.



Manual Operation:



When placing the actuator in manual operation power should be turned off to the actuator. In the event the actuator is powered and is left in a manual position, the result could lead to the internal damage of the actuator.

When placing the 90 Series motor in manual operation, the gray button must be pushed in. Then the handle can be rotated either clockwise or counter clockwise. To return back to automatic operation, rotate the handle until the button pops out.

Typical Specifications:

The electric actuator shall be a compact style, mountable on a rotary valve. The actuator shall be 24Vac powered with an ability for manual override via push in button. It shall have a clear indication of the actuator's position and be available as either a floating point or proportional style of actuator.

ESBE 90 SERIES MOTOR INSTALLATION INSTRUCTION

Mounting all 90 Series Motors on ESBE Valves (see Figs. 1-4)

- Place the sleeve (1) on the valve shaft, install and tighten the screw (2).
- Rotate the sleeve until the pointer is aligned with number 5 on the scale of the faceplate of the valve.
- The stud (3) and mounting pin (4) must be screwed into the hole on the lower left hand corner of the valve.
- The manual adjustment handle (5) must be placed on the shaft sleeve (1) facing away from the motor mounting pin. Note: If it is not facing away, the valve will not rotate fully.
- Pull out the locking clip (6) and place the motor on the valve with the red triangle facing up, push in the locking clip (6) to secure the motor.

Manual Operation, all 90 Series Motors

- To operate the valve manually, push the button on the side of the motor (item A) and hold in to turn the lever. Once the button is pressed in, the lever can be used freely. Electrical power to the motor is automatically disconnected while the button is in the lower position.

Wiring: 91M, 92M, 92-2M and 93M for "Floating" Signals (see Fig. 5)

For ESBE 92P motors, see separate section.

Warning: Always turn off all electrical power before removing or servicing the motor.

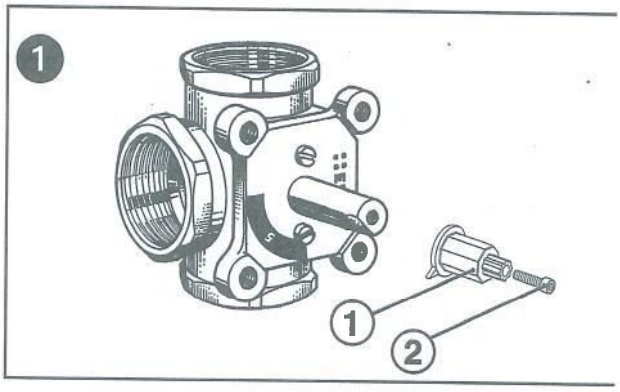
- The motor is powered using a 24VAC transformer, *3VA minimum.*
- Remove the four cover screws and lift the cover off the motor.
- Remove one (or two) of the wiring knockouts and install one (or two) of the "conduit fittings", all wires must go through these fittings.
- Attach the "common" from the control (or trans former) to terminal "N".
- Connect the control output for clockwise rotation to "Upper terminal L1", and connect the control output for counterclockwise rotation to "Lower terminal L1"

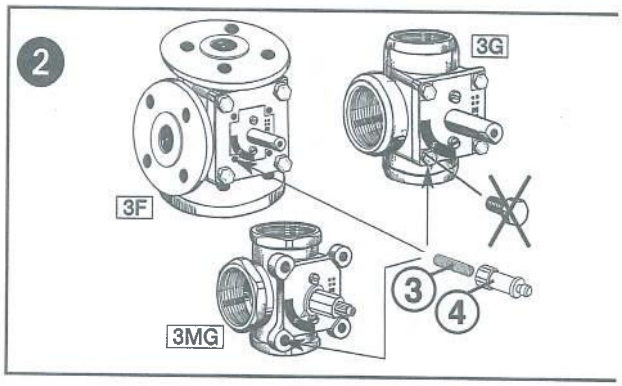
Auxiliary Switch

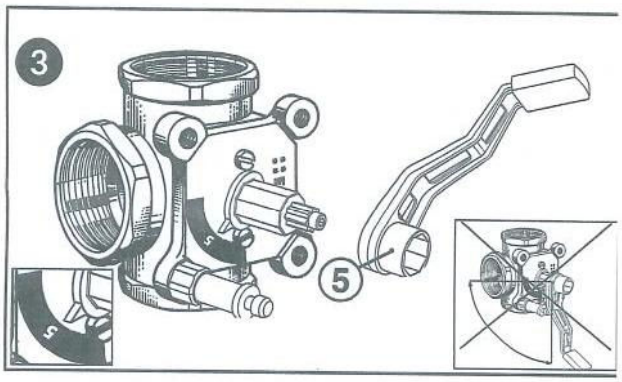
- ESBE 91M, 92M, 92-2M and 93M motors include one fully adjustable auxiliary switch. The wiring should be connected as shown in Fig. 5. To set the switching position, turn the cam (see fig 6).
  Reinstall the cover and secure it, before turning on the power.

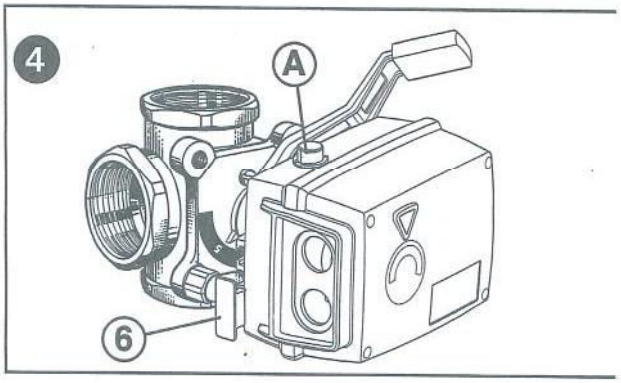
Adjusting the Degree of Rotation

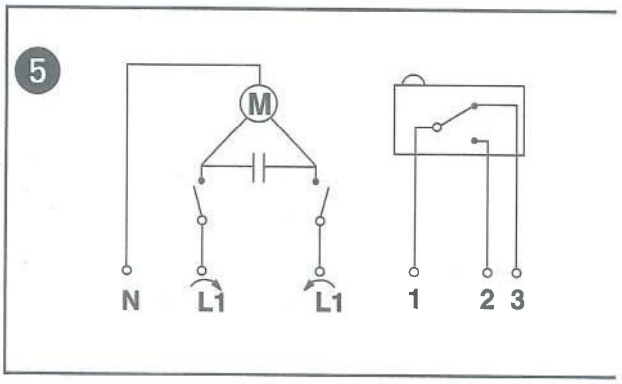
- ESBE 90 series motors do not require adjustment when used with ESBE valves, however if the motor is used for an application that requires a different degree of rotation, the cams can be adjusted to provide between 30° and 180° of rotation. For access to the cams, the cam operating the aux switch must be removed. See Fig. 7.
  Always turn off all power before adjustments are made.











Motor Speed and Signal Selection, 92P Only, for "Proportional" Signals

- With power turned off, follow instructions for removing the cover.
- The 92P is designed for operating signals of 0-5vdc, 1-5vdc, 0-10vdc, 2-10vdc, 0-20mA and 4-20mA signals. The factory default setting is 0-10vdc.
- Running speed for 90° rotation is factory set at 60 seconds, but can be changed to 90 seconds or 120 seconds.
- If required, the motor speed and operating signal can be changed to different values, as shown on the PCB card. See Fig. 9.

Wiring, 92P Only

- Connect the 24V AC or DC power supply to terminals 1 and 2. See Fig. 8.
- Connect the control signal to terminal 3.

Direction of Rotation, 92P Only

- The 92P is factory set to rotate in the clockwise direction. To change the direction of rotation to Counter-clockwise, change the position of the jumper as shown on the PCB card. See Fig. 9.

Reinstall the cover and secure it, before turning on the power

ESBE REGULATOR SERIES 92K2

Motor 92K2 – a complete unit for constant temperature regulating of
- return water to gas-, oil and solid fuel fired boilers
- under-floor heating systems
- industrial processoes

Handling

For the best control the sensor shall be placed about 3' (1 m) downstream from the valve. The sensor must be carefully insulated from the ambient temperature.

Adjusting

The function of the motor 92K2 is adjusted by two knobs:

Right hand knob

for temperature setting from 59 – 158° F
(+ 15° C to + 70° C)

Left hand knob

for selection of intervals between control signals from 1 to 70 seconds. Normally 30 seconds is suitable but depending on installation characteristics a longer or shorter interval can be used.

Direction of rotation

The direction of rotation can be reversed by changing the position of the two jumpers.

The installation shall include an approved means to disconnect the power, should service be required.

Section 1 Introduction

1.1 Statement

This manual will benefit you in several ways:

1. It will provide you with safety warnings and instructions to protect you and your equipment from injuries or damage.
2. It will assist you in keeping this equipment in the best possible mechanical condition at all times.
3. It will help you obtain the maximum performance from your equipment.

The instructions and suggestions contained in this manual are based upon practical operating experience. If followed they will help you get the most production and satisfaction from the equipment.

Everyone responsible for the operation and maintenance of your equipment must read and understand this manual before using or working on the equipment.

Our interest in the safest and most successful operation of your equipment continues throughout the life of the equipment. We want it to serve you well. For that reason, please feel free to discuss any problems you may have concerning it or the work you are doing. It will be a pleasure to help you.

Addition copies of this manual can be purchased from the equipment manufacturer.

© Wheelabrator Group, Inc.

1.2 Instruction and Warning Symbols

In this operation and maintenance manual the following symbols are used to identify important operation, maintenance and safety instructions:

1.2.1 Read!

This sign indicates advice regarding operation and maintenance.

1.2.2 Caution!

Yellow background with black text

This sign indicates rules and guidelines for a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

1.2.3 Warning!

Orange background with black text

This sign indicates rules and guidelines for a potentially hazardous situation which, if not avoided, could result in death or serious injury.

1.2.4 Danger!

Red background with black text

This sign indicates rules and guidelines for an imminently hazardous situation which, if not avoided, will result in death or serious injury. It may also be used to alert against unsafe practices

1.2.5 Electrical Hazard!

This sign indicates rules and guidelines to prevent possible severe or fatal injuries to the person and/or damage to the equipment by electrical causes.

1.3 Instructions

1.3.1 Reading about Equipment

This manual has been prepared to assist operator and maintenance personnel in understanding the equipment, so that it may be operated safely in the most efficient manner and maintained in the best condition. All personnel responsible for the operation and maintenance of the equipment must read and understand the manual, before using or working on the equipment.

© Wheelabrator Group, Inc.

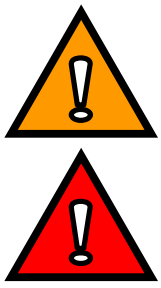
1.3.2 Understanding the Equipment

Before attempting to operate, service or maintain the equipment, personnel should thoroughly familiarize themselves with the physical make-up of the equipment, be familiar with the major components of the equipment, and have a general understanding of overall operations.

1.3.3 Equipment Operators & Maintenance Personnel Qualifications

1. Person must be of legal age for the location to operate and/or service equipment.
2. Person must be able to read and understand the English language to operate and/or service equipment.
3. Person must read and understand operation and maintenance manual before operating and or servicing the equipment.
4. Person must be trained in the operation and safety of the equipment before operating.
5. Only qualified maintenance personnel may service this equipment.

1.3.4 Warnings & Precautions



Operating and maintenance personnel must obey all the warnings and safety precautions posted on the equipment. Serious injury to personnel or severe damage to the equipment may result if the warnings and precautions are not followed.

1.3.5 Receipt of Equipment

Examine the shipment carefully for possible damage in transit. If damage is found, note the damage on the bill of lading, notify the transportation carrier immediately and advise the Wheelabrator Group.

© Wheelabrator Group, Inc.

© Wheelabrator Group, Inc.

Section 2 Safety – Warnings & Precautions

2.1 Lockout/Tagout

One of the most widely applicable industrial safety principles is Lockout/Tagout. The Occupational Safety and Health Administration (OSHA) and the American National Standards Institute (ANZI) have both addressed the requirement for Lockout/Tagout. OSHA requires that each employer formulates a written procedure for implementing a Lockout/Tagout safety program, including training employees to assure that it is properly utilized. The following are a few important points to keep in mind.

1. The principle of Lockout/Tagout is to protect personnel from the unexpected energization, start up, or release of stored energy from the equipment or process.
2. The Lockout/Tagout principle requires that locks and tags be affixed to the point where energy can be disconnected from the equipment or process.
3. Sources of energy are not restricted to electrical; that is, disconnecting the main power switch may not eliminate all sources of unexpected activation. While electrical power always should be disconnected, a person knowledgeable about the equipment or process must assess the system for circumstances in which other forms of energy may be stored and released.
4. Personnel who are most vulnerable to injury from the activation of energy are maintenance personnel who must disassemble, expose and work on the equipment in the process of repair or service.

   The following serves as a reminder to apply this important safety principle when working on the equipment.

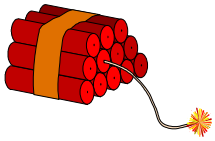
Disconnect or remove all sources of stored energy before performing maintenance or other service actions.

Failure to eliminate or block sources of stored energy can result in unexpected movement of equipment elements and cause serious injury or death.

Follow your Lockout/Tagout procedure.

© Wheelabrator Group, Inc.

2.2 Media Warnings



2.2.1 Highly Explosive Dust

Products (parts), which produce highly explosive dust, such as **Magnesium, Titanium**, **Zirconium, Thorium**, etc., should not be processed in this equipment, unless appropriate safety measures are followed (consult expert authority). Obtain approval of your plant safety director and comply with applicable NFPA (National Fire Protection Association) guidelines.

Note: Personnel should not smoke, use matches nor have open flames around this equipment during operation.

2.2.2 Aluminum Media & Parts

Comply with all applicable sections of NFPA guidelines for processing or handling of aluminum dust and fines that may be pertinent to your specific operation.

In applications involving the use of dry type bag or cartridge dust collector system and Aluminum Media or surface blasting of Aluminum Parts, precautionary measures must be taken to minimize the risk of dust collector fires and/or explosions. The following procedures should be followed.

2.2.2.1 Adding Limestone – Dry Type Collectors

No. 200 mesh agricultural limestone ($CaCO_3$) should be added to the ventilation system at a continuous rate of 0.2 oz per hour per square foot of filter area. **Caution:** $CaCO_3$ is crushed limestone rock (not to be confused with lime, otherwise known as hot lime, burnt lime or hydrated lime. These highly reactive lime products should not be used).

2.2.2.2 Dust Collector Hopper(s)

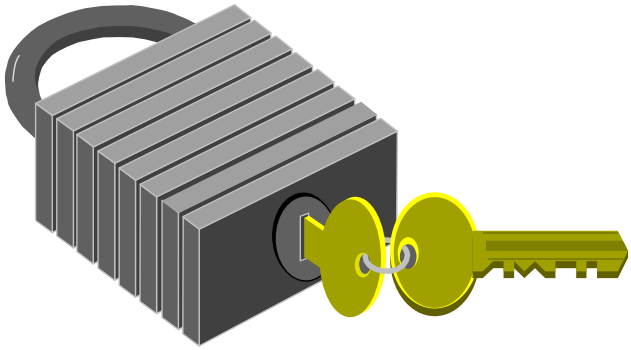
The dust collector's refuse hopper(s) must be emptied at frequent intervals and at the end of each shift of operation. Collection of more than 1/3 the hopper capacity should not be exceeded. If external containers are used to collect refuse, they must never be allowed to overfill and back up into the collector hopper. All equipment must be grounded in accordance with the National Electrical Codes (NEC) to minimize static electric charges.

© Wheelabrator Group, Inc.

2.2.2.3 Ductwork Velocity – Aluminum Applications

Maintain ductwork air velocity of not less than 4500 FPM.

2.3 Maintenance Warning - Electrical



W A R N I N G

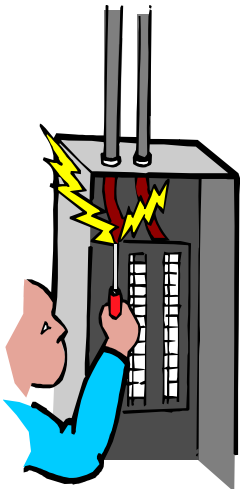
BEFORE ANY MAINTENANCE WORK IS CARRIED OUT ON THIS EQUIPMENT, THE MAIN ELECTRICAL SUPPLY SWITCH MUST BE IN THE "OFF" POSITION. ANY PERSONNEL PREFORMING ANY MAINTENANCE ON THIS EQUIPMENT MUST FOLLOW ALL APPLICABLE PLANT SAFETY STANDARD OPERATING PROCEDURES SUCH AS LOCK-OUT, TAG-OUT, ETC…

© Wheelabrator Group, Inc.

2.4 Electrical Precautions

Throughout this manual are safety warnings and precautions that must be obeyed by maintenance and operating personnel. Although the precautions which follow may seem to be over simplified, they should be included in the "Buyer's Safety Program." These are minimum safety requirements for this equipment and any additional plant safety requirements for your facility shall also be obeyed.

2.4.1 Control Panel



1. ***DO NOT*** operate the equipment with the control panel door open.

2. ***DO NOT*** use oversized fuses or bypass any fuses. Refer to Electrical Drawing.

3. ***DO*** verify the correct thermal overload(s) are installed for the motor starter(s) for the full load amp rating of the motor(s) as shown on the motor nameplate.

4. ***DO*** verify the set point knob on motor starter overload relay(s) are set to match amperage called out for on electrical drawing and matches motor nameplate data.

2.4.2 Electrical Motors

Only qualified personnel should perform electrical installation, operation and maintenance work.

1. ***DO*** verify all power sources are disconnected before attempting maintenance or repair.

2. ***DO*** follow your plants Lockout/Tagout procedures.

3. ***DO NOT*** come in contact with rotating parts.

4. ***DO*** verify motor(s) are effectively grounded. All the motor(s) on this equipment are securely fastened by metal-to-metal contact on the equipment and effectively grounded provided that the equipment is grounded. Refer to Item **3.4.4** on equipment grounding.

© Wheelabrator Group, Inc.

5. ***DO*** verify the motor's nameplate before starting the motor(s), to ensure that the correct power supply (voltage, frequency, and phase) is being used and that the motor(s) is/are connected according to the connection diagram on the nameplate. Verify that the motor is connected properly for the correct rotation. If motor(s) rotate in the wrong direction, a qualified electrical person may interchange any two line leads at the starter in the control panel.

6. ***DO NOT*** use the eyebolt on the motor(s) to lift the motor with any additional equipment attached to the motor(s).

2.4.3 Equipment Installation Wiring

DO verify the equipment is wired and connected with wire of the correct size and correct insulation.

2.4.4 Equipment Safety Grounding

1. ***DO*** verify the equipment, as installed, is effectively grounded.
2. ***DO*** verify the equipment is grounded in accordance with NEC and any other applicable state or local codes.
3. ***DO*** verify effective grounding is accomplished by providing a ground path from the equipment to a grounding electrode with a copper conductor. The ground electrode may be:
   - **a.)** An underground metal water pipe
   - **b.)** A grounded metal building frame
   - **c.)** Other local metallic underground systems, such as tanks, plates, or driven pipe or rod.
4. ***DO*** verify the grounding conductor from equipment to grounding electrode is fastened by a pressure type cable connector (no solder) to a surface that is free of dirt and paint. Electrical devices (motors, controls, etc.) securely fastened to the equipment are grounded if the equipment is grounded.

© Wheelabrator Group, Inc.

2.5 Maintenance Warning - Mechanical

2.5.1 Installation

2.5.1.1 Lift points

Safety during installation and start up requires placing the equipment without damage or injury and proper hook up to the required utility service.

The equipment may be lifted using the designated lift points that are located at a balance point. Be sure to lift the load with a proper size lifting device and follow safe rigging practices when performing this work. The proper lift points are designated on the equipment by the following sign.

2.5.1.2 Tipping Hazard

Some equipment may have work doors that may cause a change in the equipment's center of gravity when opened. Make sure all doors are securely closed before lifting and make sure equipment is securely anchored before doors are opened.

Note: DO NOT open doors on equipment until the equipment is anchored securely.

2.5.1.3 Equipment Placement

1. Be sure to allow sufficient space around the equipment to ensure that operation and maintenance can be performed without endangering personnel.
2. Inspect all access covers to make sure each is in place and secure.
3. Install vent piping to customer's dust collector system or to the dust collector supplied with the equipment.
4. Remove all foreign objects that might have been dropped or left in hoppers, elevator boot, etc.

© Wheelabrator Group, Inc.

2.5.2 Items to be checked and completed before start-up

1. Install breathers on speed reducers.✱

   a.) Remove solid fill plug(s) located at the highest position and on the slow (output) side of each reducer. Ensure oil level(s) is/are correct with recommended lubricant(s).

   b.) Replace solid fill plug with breather plug(s) which is/are enclosed in packet inside electrical panel.

   ✱ **Note:** Some units may be equipped with combination plugs that do not require replacement. Check for air/pressure vent hole in plug before removing. Only un-vented plugs need to be changed.

2. Check motor rotation on all drives.

3. This equipment is normally wired to operate from 460V AC, 3 Phase, and 60 HZ electrical supply. Factory supplied options for 575V AC, 3 Phase, 60 HZ or 230V AC, 3 Phase, 60 HZ operation are available.

4. Before starting the equipment, check that the equipment is properly wired for the voltage it will operate on.

5. Make sure all drive guards, inspection plates, etc. are in place.

2.6 Mechanical Precautions

Throughout this manual are safety warnings and precautions that must be obeyed by maintenance and operating personnel. Although the precautions that follow may seem to be over simplified, they should be included in the "Buyer's Safety Program." These are minimum safety requirements for this equipment and any additional plant safety requirements for your facility shall also be obeyed.

2.6.1 Mechanical Do's & Don'ts Items:

1. ***DO*** Achieve **Zero Mechanical State (ZMS)** before performing maintenance on the equipment.

   a.) ***DO*** lockout every power source that can produce mechanical movement.

© Wheelabrator Group, Inc.

b.) ***DO*** lockout shut off valves for pressurized fluid (air, oil or other).

c.) ***DO*** reduce all accumulators and air surge tanks to atmospheric pressure.

d.) ***DO*** achieve the lowest practical value for mechanical potential energy for all portions of the equipment.

Example: A belt and bucket elevator system that has stopped with the buckets containing abrasive may reverse from the weight of the abrasive in the buckets.

e.) ***DO*** achieve the lowest practical value for kinetic energy of the equipment members. Loose or freely movable equipment members and parts must be secured against accidental movement.

Example: A rotating part, such as an airless blast wheel, will continue to rotate for a period of time after the electrical power has been disconnected.

2. ***DO*** keep all guards in place, except during maintenance or repair work. Remount all guards upon completion of any maintenance or repair work.

3. ***DO*** wear safety glasses while working near or on the equipment.

4. ***DO*** wear gloves, when applicable, when working near and on the equipment.

5. ***DO NOT*** wear loose fitting clothes, jewelry and watches, while working near belts, chains, sprockets, shafts or other components that are movable.

6. ***DO*** keep the areas around all equipment clean. Loose abrasive media and dust can cause hazardous conditions.

7. ***DO*** immediately correct any condition(s) that may result in damage to the equipment or cause injury to personnel.

© Wheelabrator Group, Inc.

8. ***DO NOT*** use your hands to remove excess abrasive from the elevator boot section, rotary screen, screw conveyor or shaker conveyor. Always use a scoop or scraper for removing this abrasive.

9. ***DO NOT*** attempt to adjust the feed spout, or other wheel parts while the blast wheel is operating or rotating.

10. ***DO NOT*** attempt to adjust the component parts of the abrasive recycling system or the work parts conveyor system while any part of the blast equipment is in operation.

11. ***DO NOT*** remove access covers or panels while equipment is operating. Always follow your facility's Lockout/Tagout procedures before removing any covers or panels.

12. ***DO*** obey all safety signs (caution, warning & danger) and other precautionary information posted on the equipment or in the equipment operating area.

© Wheelabrator Group, Inc.

2.7 Safety Signs

The following safety and danger signs may appear on and around the equipment, it is important that their meaning is fully understood by all operators and maintenance personnel who will come in contact with the equipment.

2.7.1 Notice Signs

Notice Signs	Description
 	Part Number: **C81261 & C253704** Location: This sign is located at eye level on ladders to service platforms, at the operator's station and all access doors on the equipment. Meaning: This sign warns that only authorized personnel and operators should have admittance to the area.

© Wheelabrator Group, Inc.

2.7.2 Warning Signs

Warning Signs	Description
 	Part Number: **C80805 & C253707** Location: This sign is located at eye level on all inspection, access and work doors on the equipment. Meaning: This sign warns the operator or service personnel to wear safety glasses when servicing or operating the equipment.
 	Part Number: **C59602 & C253707** Location: This sign is located at eye level on ladders to service platforms, at the operator's station and all access doors on the equipment. Meaning: This sign warns the operator or service personnel to watch their step around the equipment due to possible media on floor.

© Wheelabrator Group, Inc.

2.7.3 Danger Signs

Danger Signs	Description
	Part Number: **C243990-1** Location: This sign is located on the main control panel. Meaning: This sign warns against having an open flame, creating a spark and smoking around the equipment.
	Part Number: Location: This sign is located on conveyors, and the entrance and exit of the equipment. Meaning: This equipment includes for moving conveyors at the entrance and exit, and a belt and bucket elevator system.

© Wheelabrator Group, Inc.

Danger Signs	Description
 	Part Number: **C243991-1** Location: This sign is located on the entrance and exit of the equipment. Meaning: This sign warns the operator or service personnel that the equipment is controlled through the main control panel and once initiated by the operator and the system starts automatically.

Signs to be Translated

English	Arabic
DANGER HIGH VOLTAGE	خطر التيار العالي
DANGER STARTS AUTOMATICALLY	الخطر ينطلق تلقائيا
AUTHORIZED PERSONNEL ONLY	الأفراد المصرح لهم فقط
WATCH FOR MOVING EQUIPMENT	آنظر حولك لنقل المعدات

Section 3 Media Handling System

3.1 Function of the Lower Reclaim:

The lower reclaim function is to collect contaminants spent media thrown by the blast wheels. The media and contaminants are then delivered by the lower reclaim to the bucket elevator boot section. The lower reclaim is part of a total media recovery system to clean and recycle media back to the blast wheel.

3.1.1 Types of Lower Reclaims:

3.1.1.1 Full Gravity Reclaims:

a. Gravity hoppers are used for directing spent media directly to the bucket elevator boot section.

b. Gravity hoppers are generally used on small equipment.

c. There are no drives or mechanical moving parts in gravity reclaims.

3.1.1.2 Lower Screw Conveyor Reclaims:

a. Lower screw conveyors are used when full gravity is not feasible and the product application does not have significant amounts of tramp metal entering the screw area that would otherwise result in jams. Screws may be protected by shed plates, grating and/or screen.

b. The volume of media flow determines the size of screw conveyor and horsepower required to move the abrasive to the bucket elevator boot section.

© Wheelabrator Group, Inc.

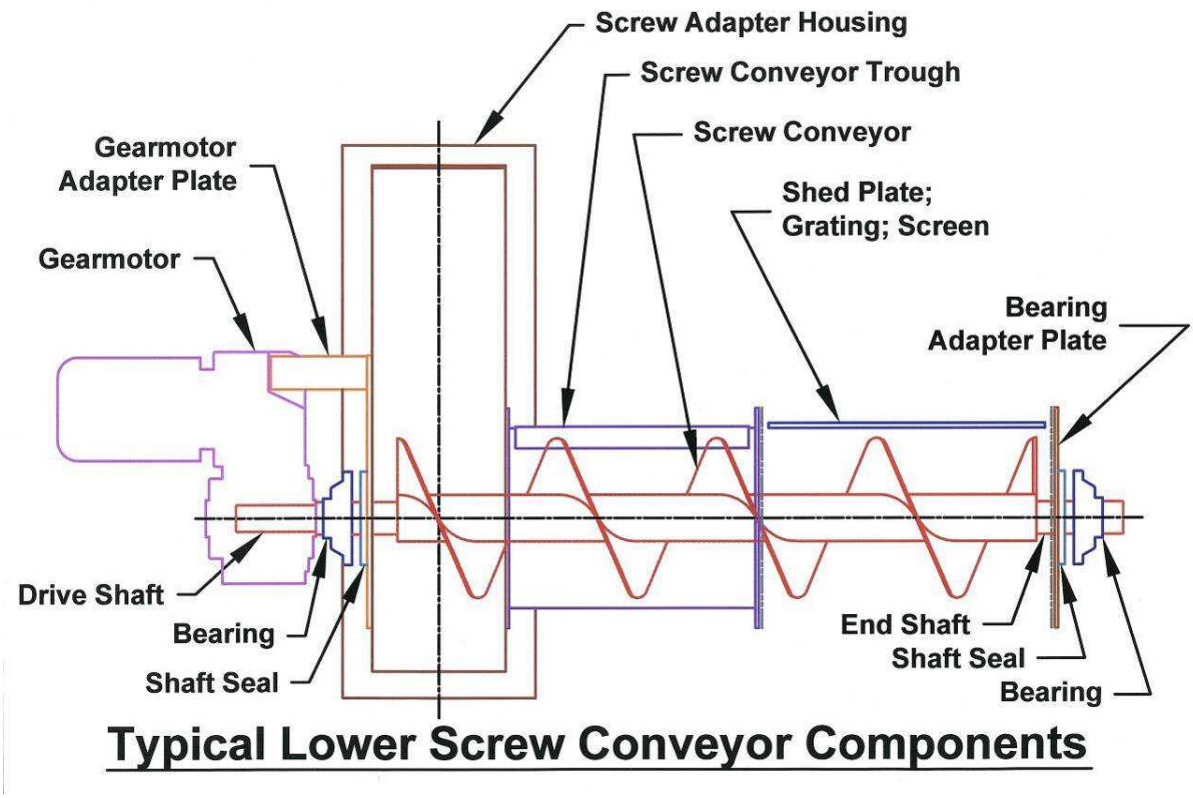

Figure 3-1

c. Typical components of a lower screw conveyor reclaim are shown in **Figure 3-1**.

1. **Screw Conveyor** – flighting and tube construction to deliver media to the bucket elevator boot section.

2. **Screw Conveyor Trough** – connects and encloses the screw conveyor between the blast chamber and elevator boot. This may not be required on all applications.

3. **Shed Plate; Grating; Screen** – may be provided to protect the screw from objects that could jam the screw conveyor and also to meter the abrasive to the screw conveyor.

© Wheelabrator Group, Inc.

4. **Screw Adapter Housing** – joins the screw conveyor trough to the elevator boot or cabinet. This may not be required on all applications.

5. **Drive Shaft** – fixed to the screw conveyor and mounted through the bearing to drive the conveyor.

6. **End Shaft** - fixed to the screw conveyor and mounted through the bearing to support the conveyor opposite the drive.

7. **Shaft Seals** – prevents media leaking out the ends of the conveyor and protects the bearings from the media. (see **Figures 3-2** & **3-3**)

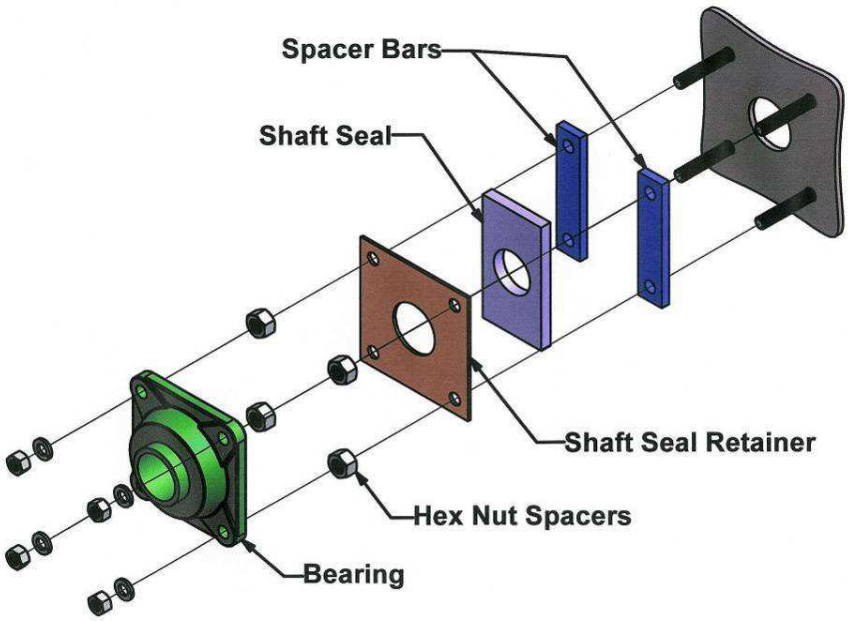
8. **Bearings** – supports ends of the screw conveyor.

9. **Bearing Adapter Plate** – closes the end of the conveyor and supports the bearing.

10. **Gearmotor Adapter Plate** - closes the end of the conveyor and supports the bearing and Gearmotor.

11. **Gearmotor** – mounted on drive shaft to power screw conveyor.

© Wheelabrator Group, Inc.



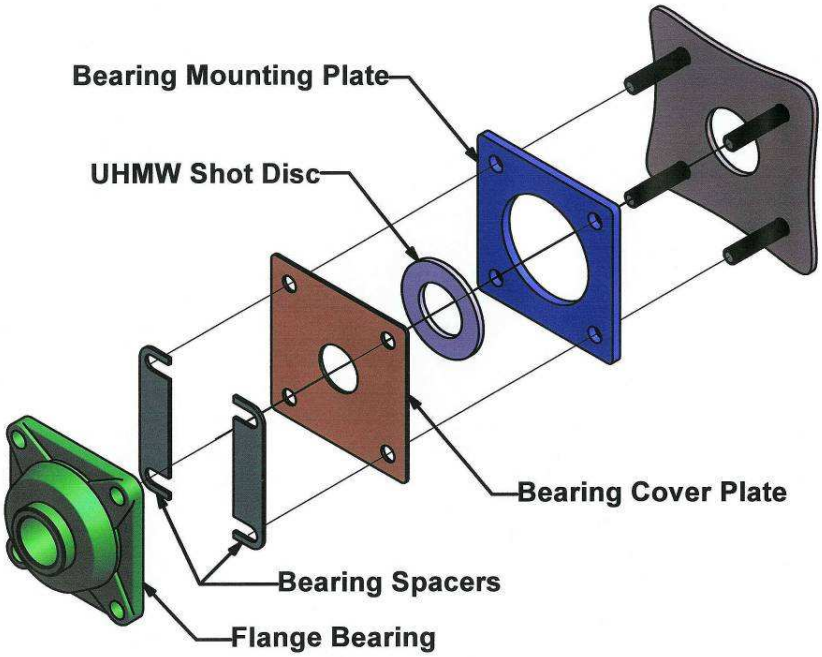
Typical Shaft Seal Assembly

Figure 3-2

d. A typical shaft seal assembly for a lower screw conveyor is shown in **Figure 3-2**.

1. **Shaft Seal Spacer Bars** – maintains a space between the adapter plate and the shaft seal retainer for the shaft seal to mount. This allows maintains proper compression of the felt shaft seal.
2. **Shaft Seal** – prevents media leaking out the ends of the conveyor and protects the bearings from the media.
3. **Shaft Seal Retainer** – retains the shaft seal between the shaft seal spacer bars.
4. **Hex Nut Spacers** – maintains a space between the shaft seal retainer and the flange bearing. This allows any media that made it by the shaft seal to drain before contaminating the flange bearing.
5. **Bearing** – supports ends of the screw conveyor.

© Wheelabrator Group, Inc.



Typical Shaft Seal Assembly

Figure 3-3

e. Another variation of a shaft seal assembly for a lower screw conveyor is shown in **Figure 3-3**.

1. **Bearing Mounting Plate** – is the base for mounting the other components of the bearing assembly.
2. **UHMW Shot Disc** – prevents media leaking out the ends of the conveyor and protects the bearings from the media.
3. **Bearing Cover Plate** – retains the UHMW shot disc in the bearing mounting plate.
4. **Bearing Spacers** – maintains a space between the bearing cover plate and the flange bearing. This allows any media that made it by the shot disc seal to drain before contaminating the flange bearing.
5. **Flange Bearing** – supports ends of the screw conveyor.

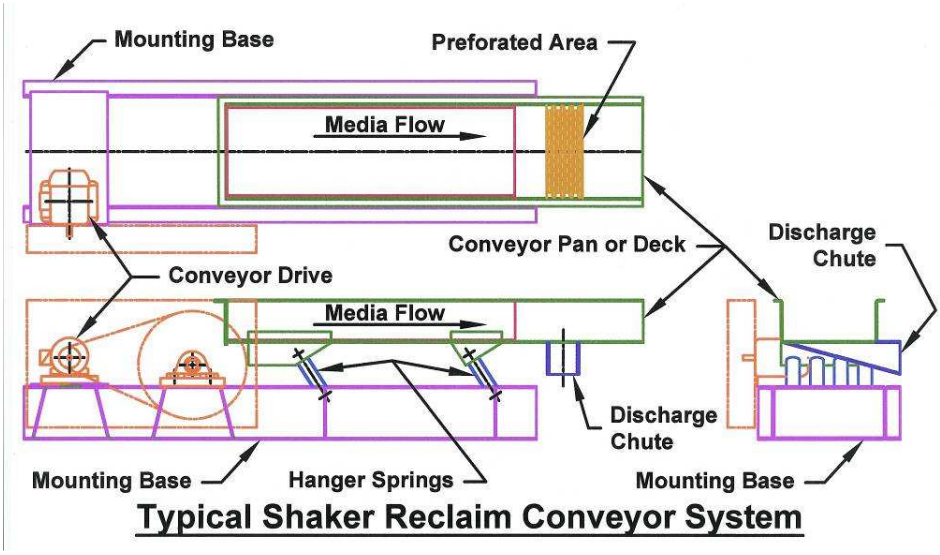
© Wheelabrator Group, Inc.

3.1.1.3 Shaker Conveyor Reclaims:

a. Shaker conveyors are used when full gravity is not feasible and the product application contains significant tramp metal material entering the reclaim.

b. Shaker conveyors are able to separate large trash from the media to prevent it entering the remaining media handling system components and causing damage or jams.

c. Shaker conveyors are generally self cleaning.



Typical Shaker Reclaim Conveyor System

Figure 3-4

d. A typical shaker conveyor reclaim system is shown in **Figure 3-4**.

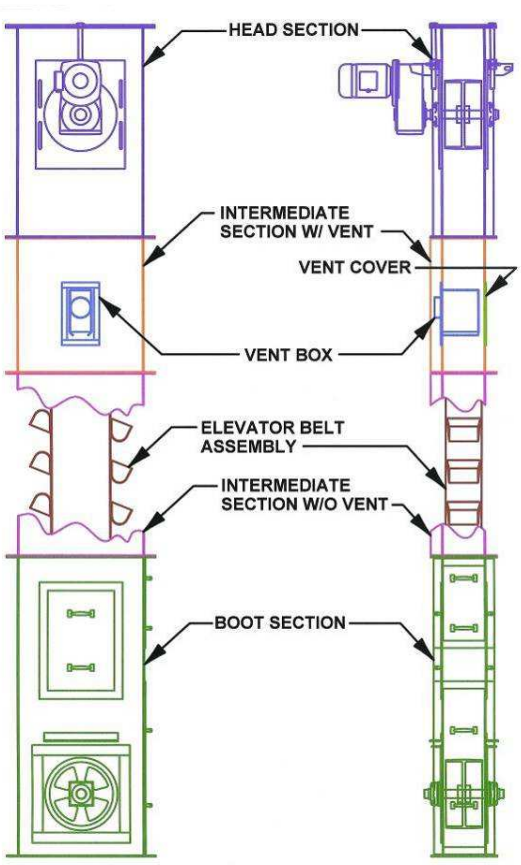
1. **Conveyor Pan or Deck** – controls media and trash while it is being conveyed and reclaimed.
2. **Conveyor Pan Liner** – protects pan from abrasion and impact.
3. **Perforated Area** – separates large trash from media before media is delivered to the elevator boot section.
4. **Discharge Chute** – delivers media to the elevator boot section.

© Wheelabrator Group, Inc.

5. **Mounting Base** – supports the shaker conveyor and secures it to the foundation.
6. **Hanger Springs** – are sized to control stroke, frequency and angle of attack designed to proper conveying action for type media.
7. **Conveyor Drive** – powers the shaker conveyor.

3.2 Function of the Bucket Elevator

a. The belt and bucket centrifugal discharge elevator lifts the abrasive material from the boot (lower) section to the head (upper) section. The contaminated abrasive material is discharged from the head section of the elevator, and then delivered to the separator.



Typical Elevator Arrangement

Figure 3-5

© Wheelabrator Group, Inc.

b. A typical elevator arrangement is shown in **Figure 3-5**.

1. **Head Section** – This is the upper section of the bucket elevator casing. It usually contains the elevator drive.
2. **Intermediate Section with Vent** – This is the part of the elevator casing that contains the vent box.
3. **Vent Box** – This is the outlet to remove the dust from of the elevator casing. It can usually be mounted on either side of the intermediate section depending on the vent piping requirement.
4. **Vent Cover** – Covers the opening in the intermediate section opposite the vent box when part of design.
5. **Intermediate Section without Vent** – This is the part of the elevator casing used to increase the height of the elevator. This section is not always required.
6. **Boot Section** – This is the lower section of the bucket elevator casing. This section receives the spent media from the blast chamber and lower reclaim.
7. **Elevator Belt Assembly** - This bucket and belt assembly transports the abrasive media from the boot section to the head section and discharges it to the upper reclaim system.

3.2.1 Elevator Head Section

a. The head section is the upper section of the bucket elevator casing. It receives the abrasive media from the boot section of the elevator and discharges the abrasive media into the upper reclaim system.

© Wheelabrator Group, Inc.

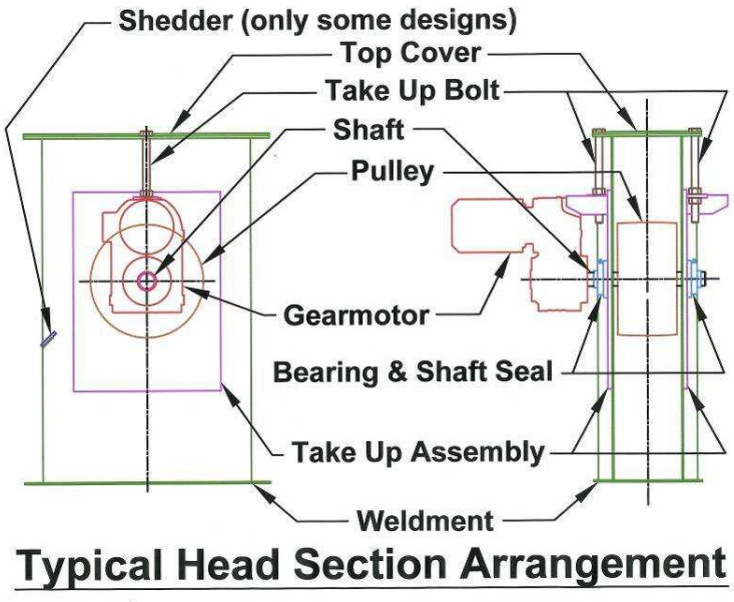


Figure 3-6

b. A typical elevator head section arrangement is shown in **Figure 3-6**.

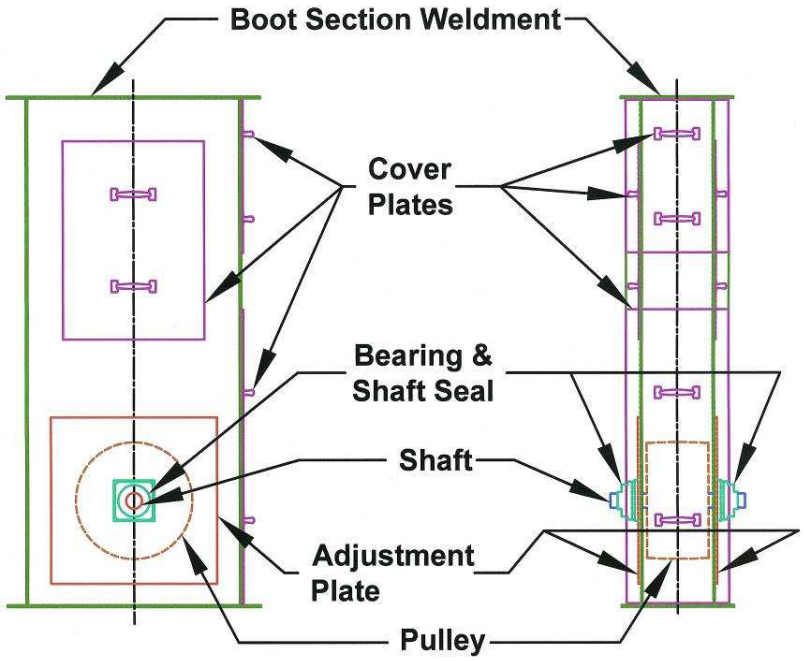
1. **Weldment** – is a fabricated housing that the head section components mount to.
2. **Take Up Assembly** – supports the bearings, shaft seals, shaft and pulley on the weldment. They slide up and down to adjust the tension of the elevator belt assembly. There are two take up assemblies per head section.
3. **Take Up Bolts** – are the links between the weldment and the take up assemblies. Turning the bolts clockwise will tighten the elevator belt and turning the bolts counter-clockwise will loosen the elevator belt. These bolts are also used to adjust the tracking of the elevator belt.
4. **Pulley** – provides a rotating surface to drive the elevator belt assembly. The pulley is usually crowned and lagged to assist in tracking the elevator belt assembly.
5. **Shaft** – supports the elevator head section pulley.
6. **Shaft Seal** – prevents media leaking out from the take up assembly plates and protect the bearings from the media.

© Wheelabrator Group, Inc.

7. **Bearing** – supports ends of the elevator head section shaft.
8. **Gearmotor** – is mounted to the head section shaft to power the elevator.
9. **Top Cover** – is the access cover to the elevator head section and a safety cover to guard against the rotating components inside the elevator head section weldment.
10. **Shedder** – is a wear component to assist in delivery of abrasive media and contaminants to the upper reclaim system. This is only used on some designs of elevator head sections.

3.2.2 Elevator Boot Section

a. The boot section is the lower section of the bucket elevator casing. It receives the abrasive media and contaminant from the lower reclaim of the equipment and moves the media and contaminants to the head section with the elevator belt assembly.



Typical Boot Section Arrangement

Figure 3-7

© Wheelabrator Group, Inc.

b. A typical elevator boot section arrangement is shown in **Figure 3-7**.

1. **Boot Section Weldment** – is a fabricated housing that the boot section components mount to.

2. **Adjustment Plate** – supports the bearings, shaft seals, shaft and pulley on the boot section weldment. There are usually two of these plates per boot section.

3. **Pulley** – provides a rotating surface for the elevator belt assembly to ride on.

4. **Shaft** – supports the elevator boot section pulley.

5. **Shaft Seal** – prevents media leaking around the shaft and protects the bearings from the media.

6. **Bearing** – supports ends of the elevator boot section shaft.

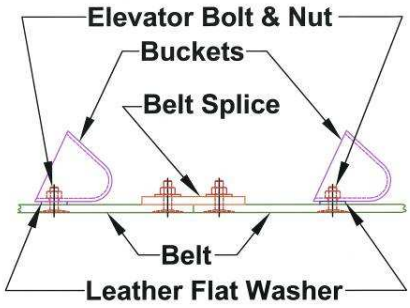
Note: See Section 3.1.1.2 (d & e) for the two types of typical shaft seal assemblies. Also see Figures 3-2 and 3-3.

7. **Cover Plates** – are the access covers to the elevator boot section and a safety cover to guard against the rotating components inside the elevator boot section weldment.

3.2.3 Elevator Belt Assembly

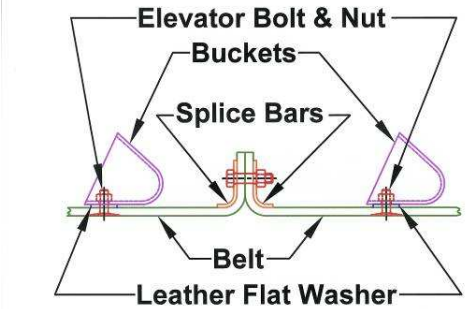
a. The elevator belt assembly carries the abrasive media and contaminants in buckets from the elevator boot section to the elevator head section. The belt tracks on the elevator head and boot pulleys.

© Wheelabrator Group, Inc.



Typical Elevator Belt Assembly with Dutchman Splice

Figure 3-8



Typical Elevator Belt Assembly with Oil Well Splice

Figure 3-9

b. Typical elevator belt assemblies are shown in **Figure 3-8** with a Dutchman splice and **Figure 3-9** with an Oil Well splice.

1. **Elevator Belt** – is manufactured from a multi-ply rubber belting material with an abrasive resistant top cover for protection against abrasion and cutting. The elevator buckets and splice are mounted to the belt.

2. **Buckets** – carry the abrasive media. They are usually made out of cast ductile iron for better wear life.

3. **Leather Flat Washer** – spaces the buckets off the belt to help prevent edge of buckets cutting into the belt.

4. **Belt Splice & Splice Bars** – joins the two ends of the elevator belt together to make one continuous belt. There are two types of splices. The Dutchman splice is usually used on low temperature belts and in smaller size elevators. The Oil Well splices are usually used on high temperature belts and in larger size elevators.

© Wheelabrator Group, Inc.

3.3 Functions of Upper Reclaims

The upper reclaim function is to collect media and contaminants delivered from the elevator. Media and contaminants are then conveyed by the upper reclaim to the media separator. The upper reclaim is a part of a total media recovery system to clean and recycle media back to the blast wheel.

3.3.1 Types of Upper Reclaims:

3.3.1.1 Full Gravity Reclaims

a. Gravity reclaims are used for transferring media directly from the elevator head section to the separator.

b. There are no drives in upper gravity reclaims.

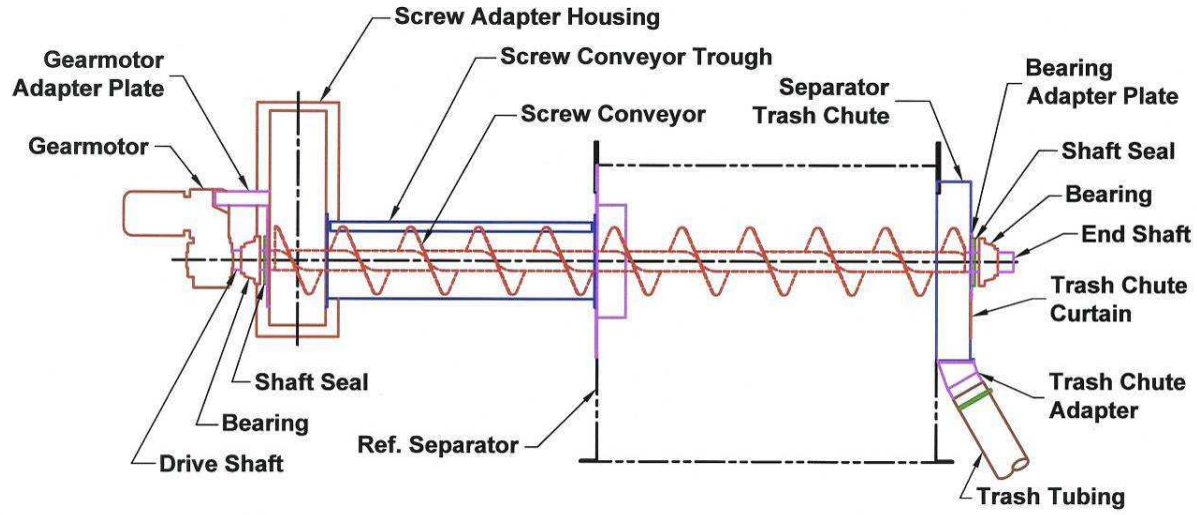
3.3.1.2 Upper Screw Conveyor Reclaims

a. Upper screw conveyors are used to reduce system height when full gravity is not feasible.

b. The volume of media flow determines the size of screw conveyor and horsepower required to move the abrasive media from the bucket elevator to the separator.

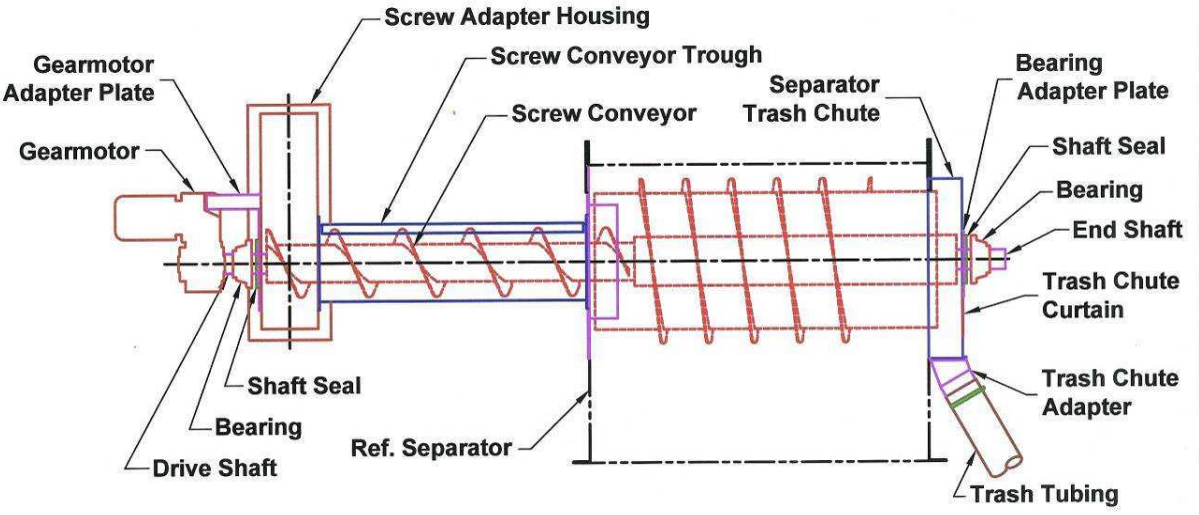
c. There are two styles of upper screw reclaim. One is a standard screw conveyor and the other is a screw conveyor with a rotary screen.
(See **Figures 3-10** & **3-11**)

© Wheelabrator Group, Inc.



Typical Upper Screw Conveyor Components

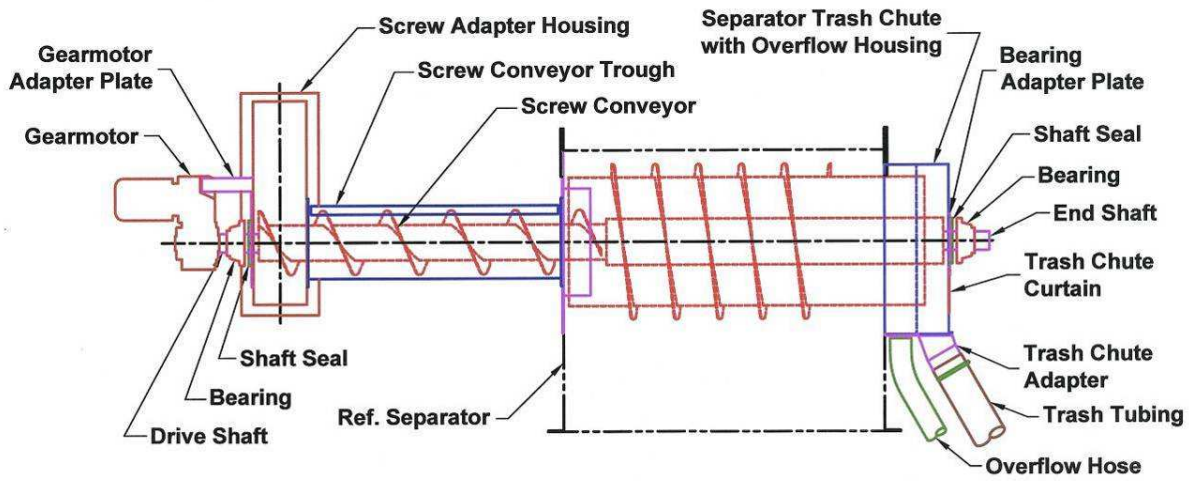
Figure 3-10



Typical Upper Screw Conveyor Components with Rotary Screen

Figure 3-11

© Wheelabrator Group, Inc.



Typical Upper Screw Conveyor Components with Rotary Screen and Trash Chute with Overflow Housing & Hose

Figure 3-12

d. The following are typical components of an upper screw conveyor reclaim are shown in **Figure 3-10** upper screw conveyor and **Figure 3-11** upper screw conveyor with rotary screen **Figure 3-12** upper screw conveyor with rotary screen screw and trash chute with overflow housing & hose.

1. **Screw Conveyor** – flighting and tube construction to deliver media and contaminants from the bucket elevator to the separator.

2. **Rotary Screen** – is a scalping drum that allows the abrasive and contaminants to flow through a screen, but holds large tramp material inside the screen where it is conveyed to a trash chute. The rotary screen directs any large particles away from the air wash and discharges them into the trash chute to a refuse container.

© Wheelabrator Group, Inc.

3. **Screw Conveyor Trough** – connects and encloses the screw conveyor between the bucket elevator and the separator.

4. **Screw Adapter Housing** – joins the screw conveyor trough to the elevator head section.

5. **Separator Trash Chute** – the rotary screen empties the large trapped particles into this housing.

6. **Separator Trash Chute with Overflow Housing**– when there is a surge of media the media is overflowed into the first compartment of the housing. The rotary screen empties the large trapped particles into the second compartment of the housing.

7. **Overflow Hose** – directs the overflow media back to lower reclaim to be recycled.

8. **Trash Chute Curtain** – allows access to clean out any trapped particles that are clogging the entrance to the trash tube.

Warning: DO NOT clean out separator trash chute with power on the equipment or with the screw conveyor or screen running.

9. **Trash Chute Adapter** – attaches the separator trash chute to the trash tubing.

10. **Trash Tubing** – conveys discharged trash particles from the rotary screen to the buyer's trash receptacle.

11. **Drive Shaft** – fixed to the screw conveyor and mounted through the bearing to drive the conveyor.

12. **End Shaft** - fixed to the screw conveyor and mounted through the bearing to support the conveyor opposite the drive.

© Wheelabrator Group, Inc.

13. **Shaft Seals** – prevents media leaking out the ends of the conveyor and protects the bearings from the media.

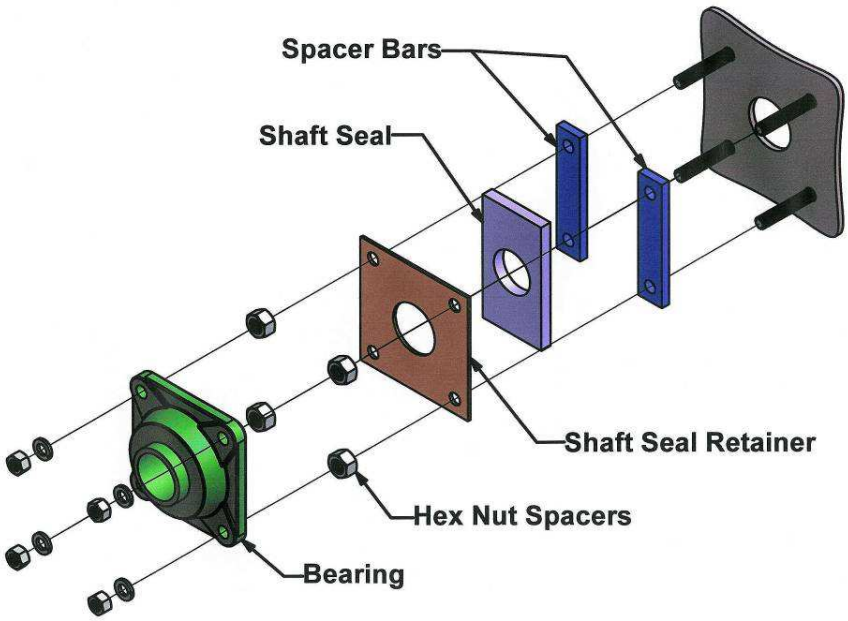
14. **Bearings** – supports both ends of the screw conveyor.

15. **Bearing Adapter Plate** – mounts to the separator trash chute for mounting the bearing.

16. **Gearmotor Adapter Plate** - closes the end of the conveyor and for mounting the bearing and gearmotor.

17. **Gearmotor** – mounted on drive shaft to power screw conveyor.

© Wheelabrator Group, Inc.



Typical Shaft Seal Assembly

Figure 3-13

e. A typical shaft seal assembly for an upper screw conveyor is shown in **Figure 3-13**.

1. **Shaft Seal Spacer Bars** – maintains a space between the adapter plate and the shaft seal retainer for the shaft seal to mount. This allows maintains proper compression of the felt shaft seal.
2. **Shaft Seal** – prevents media leaking out the ends of the conveyor and protects the bearings from the media.
3. **Shaft Seal Retainer** – retains the shaft seal between the shaft seal spacer bars.
4. **Hex Nut Spacers** – maintains a space between the shaft seal retainer and the flange bearing. This allows any media that made it by the shaft seal to drain before contaminating the flange bearing.
5. **Bearing** – supports both ends of the screw conveyor.

© Wheelabrator Group, Inc.

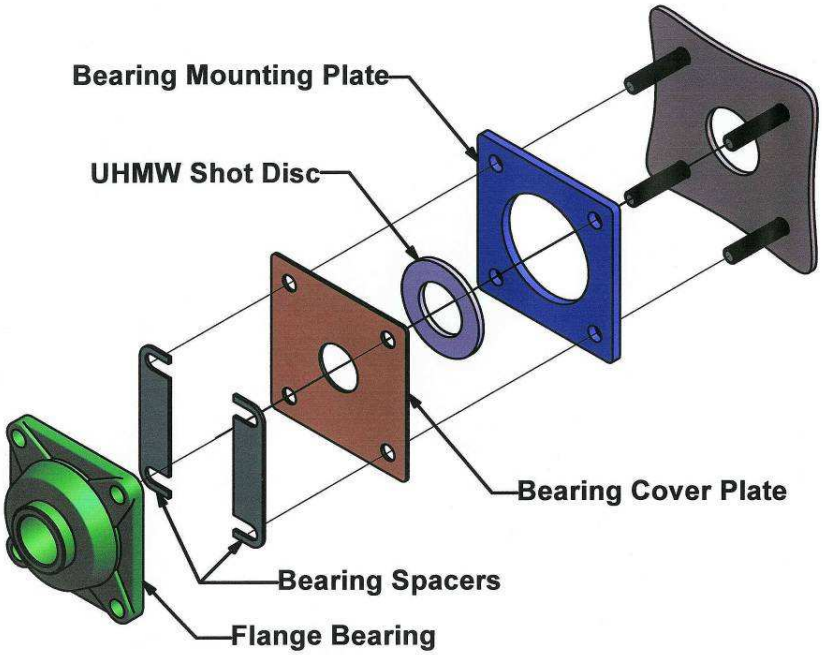


Figure 3-14

f. Another variation of a shaft seal assembly for an upper screw conveyor is shown in **Figure 3-14**.

1. **Bearing Mounting Plate** – is the base for mounting the other components of the bearing assembly.
2. **UHMW Shot Disc** – prevents media leaking out the ends of the conveyor and protects the bearings from the media.
3. **Bearing Cover Plate** – retains the UHMW shot disc in the bearing mounting plate.
4. **Bearing Spacers** – maintains a space between the bearing cover plate and the flange bearing. This allows any media that made it by the shot disc seal to drain before contaminating the flange bearing.
5. **Flange Bearing** – supports ends of the screw conveyor.

© Wheelabrator Group, Inc.

3.4 Functions of a Separator

The separator receives contaminated abrasive media from the upper reclaim. In the separating process, the abrasive media is spread out for uniform distribution through the separator to remove the contaminants from the abrasive media. The abrasive contaminants are delivered to the refuse side of the separator. These contaminants are conveyed to the customer's refuse container by means of flexible tubing with a dribble valve.

3.4.1 Types of Separators:

3.4.1.1 Gravity CFS Separator (Figure 3-15)

a. The gravity CFS (Compensating Flow Straight) separator receives the abrasive media and contaminants from the head section of the elevator.

b. The large contaminants are screened out through a stationary screen.

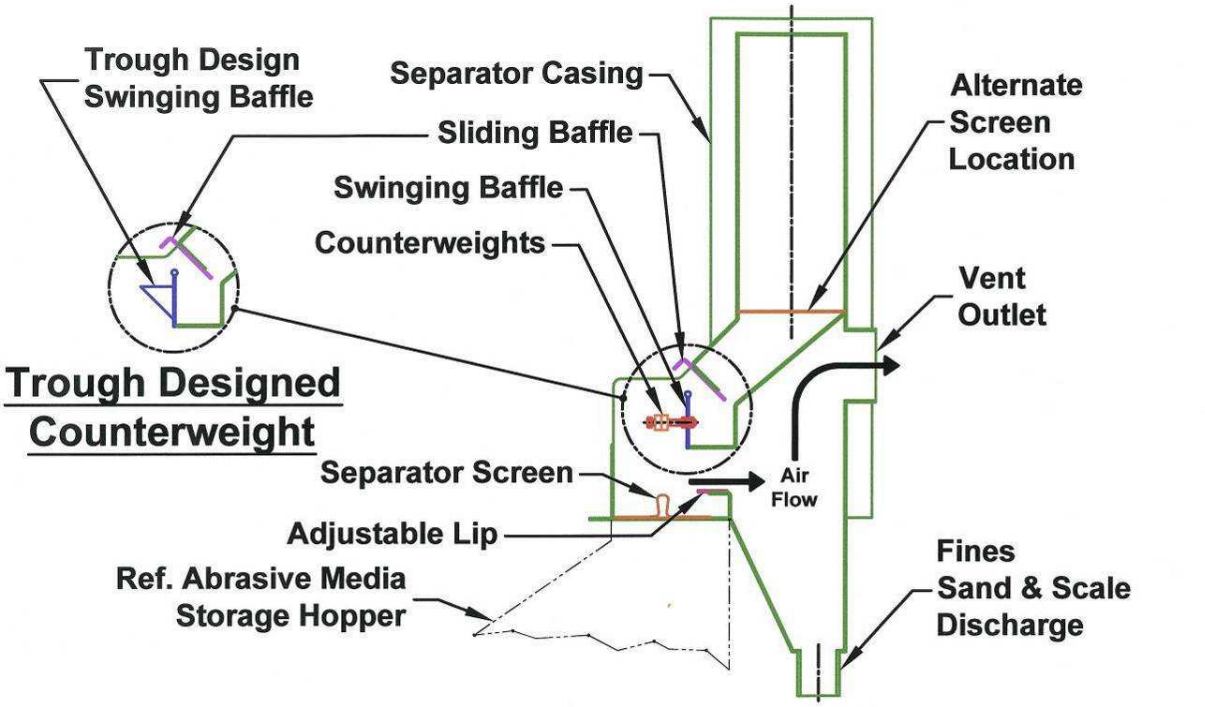
c. The usable abrasive media is separated from the fine abrasive media, sand and scale.

- This is achieved by pulling air through a curtain of abrasive media.
- This curtain is maintained across the full width of the separator by a sliding baffle and counterweighted swinging baffle system.

d. The cleaned usable abrasive media is directed to the storage hopper.

e. The fines, sand and scale are directed to the buyer's receptacle at floor level.

© Wheelabrator Group, Inc.



Typical Gravity CFS Separator Arrangement

Figure 3-15

f. The following are typical components of a gravity CFS separator as shown in **Figure 3-15**.

1. **Separator Casing** – is used to mount the separator components and retain the abrasive media and contaminants to be cleaned.

2. **Sliding Baffle** – is adjustable and regulates the volume of abrasive media and contaminants flowing to the swinging baffle.

3. **Swinging Baffle** – is the mechanism which controls the flow of contaminated abrasive media in a thin curtain across the entire width of the separator at the point of separation.

© Wheelabrator Group, Inc.

Make sure the swinging baffle will not stick on the ends near the vertical housing wall. Grind the edges for clearance if required. The vertical back of the swinging baffle should be perpendicular with the edge of the adjustable lip. Use the slotted holes for the bearing mounts to adjust the position of the baffle as required. The bottom edge of the baffle should clear the adjustable lip by approximately 1/8". This gap may change, based on the size abrasive used, to prevent sticking of the baffle on the horizontal lip. Correct clearance allows the baffle to push against the build up of abrasive on top of the lip and prevent any partial curtain leakage of abrasive.

4. **Counterweights** – are used to adjust the swinging baffle to obtain a full width curtain. By moving the adjustable counterweights up and back on the rod or adding or removing abrasive from the trough designed counterweights the thickness and width of the abrasive curtain of abrasive can be adjusted.

5. **Adjustable Lip** – is adjusted back about ½" behind the vertical fall line from the upper lip that swinging baffle closes on. The lower lip may need additional adjustment depending on the size, weight and volume of contaminants.

6. **Separator Screen** – stops large contaminants before they can get to the wheel unit. The screen should be cleaned daily to assure unrestricted abrasive flow to the wheels. Care should be taken when cleaning the screen to assure the contaminants do not fall into the abrasive storage hopper.

3.4.1.2 CFS Separator w/Upper Screw Conveyor Reclaim (Figure 3-16)

a. The CFS (Compensating Flow Straight) separator receives contaminated abrasive media from the upper screw conveyor reclaim.

b. The large contaminants are screened out through a rotary screen.

© Wheelabrator Group, Inc.

c. The usable abrasive media is separated from the fine abrasive media, sand and scale.

- This is achieved by pulling air through a curtain of abrasive media.
- This curtain is maintained across the full width of the separator by a sliding baffle and counterweighted swinging baffle system.

d. The screened usable abrasive media is directed to the storage hopper.

e. The fines, sand and scale are directed to the buyer's receptacle at floor level.

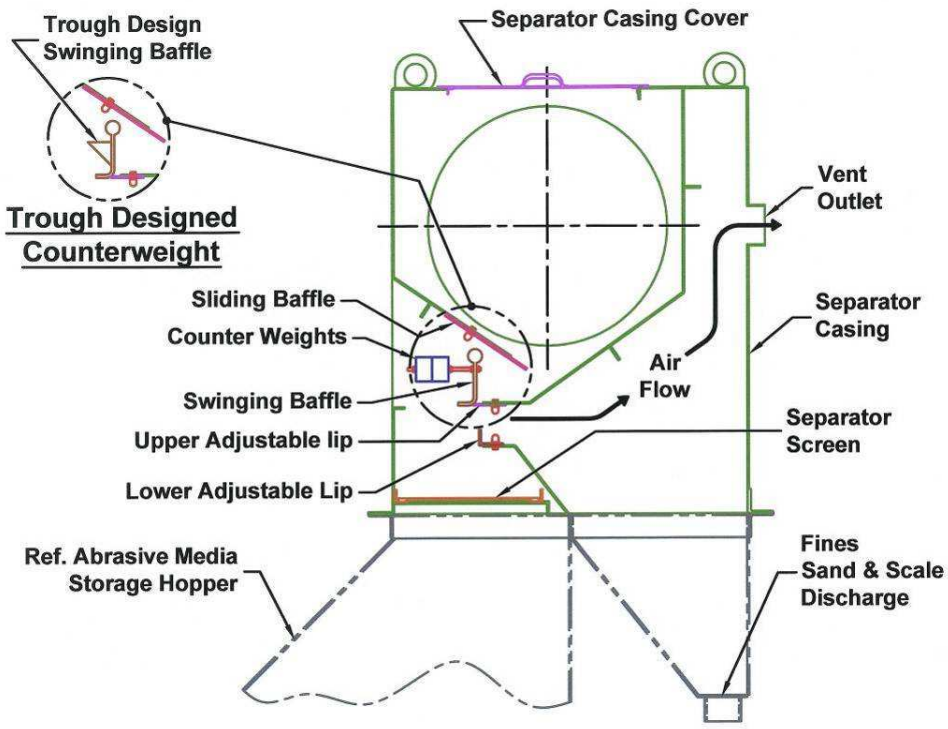


Figure 3-16

f. The following are typical components found in a CFS separator with upper screw conveyor reclaim as shown in **Figure 3-16**.

© Wheelabrator Group, Inc.

1. **Separator Casing** – is used to mount the separator components and retain the abrasive media and contaminants to be cleaned.
2. **Separator Casing Cover** – is for access to the upper screw conveyor and rotary screen.

Warning: DO NOT remove separator casing cover with power on the equipment or with the screw conveyor or screen running.

3. **Sliding Baffle** – is adjustable and regulates the volume of abrasive media and contaminants flowing to the swinging baffle.
4. **Swinging Baffle** – is the mechanism which controls the flow of contaminated abrasive media in a thin curtain across the entire width of the separator at the point of separation.

   Make sure the swinging baffle will not stick on the ends near the vertical housing wall. Grind the edges for clearance if required. The vertical back of the swinging baffle should be perpendicular with the edge of the adjustable lip. Use the slotted holes for the bearing mounts to adjust the position of the baffle as required. The bottom edge of the baffle should clear the adjustable lip by approximately 1/8”. This gap may change, based on the size abrasive used, to prevent sticking of the baffle on the horizontal lip. Correct clearance allows the baffle to push against the build up of abrasive on top of the lip and prevent any partial curtain leakage of abrasive.
5. **Counterweights** – are used to adjust the swinging baffle to obtain a full width curtain. By moving the adjustable counterweights up and back on the rod or adding or removing abrasive from the trough designed counterweights the thickness and width of the abrasive curtain of abrasive can be adjusted.

© Wheelabrator Group, Inc.

6. **Upper Adjustable Lip** – is adjusted to keep the back face of the swinging baffle vertical and parallel with the air opening behind the abrasive media curtain.

7. **Lower Adjustable Lip** – is adjusted back about ½" behind the vertical fall line from the upper lip that swinging baffle closes on. The lower lip may need additional adjustment depending on the size, weight and volume of contaminants.

8. **Separator Screen** – stops large contaminants before they can get to the wheel unit. The screen should be cleaned daily to assure unrestricted abrasive flow to the wheels. Care should be taken when cleaning the screen to assure the contaminants do not fall into the abrasive storage hopper.

3.4.1.3 LP Magnetic Separators

The LP (Low Profile) series of magnetic separators provide a significant improvement in operating efficiency and cost reduction for blast cleaning equipment in a typical foundry.

Using a two (2) stage approach, the LP units remove coarse and fine non metallic contaminants from the steel abrasive operating mix and metallic fines from the non metallic waste stream.

The primary benefits are:

1. Increased life of wheel components over systems with air wash only separators.

2. Reduced maintenance on the blast equipment and dust collector.

3. Reduced loss of usable abrasive and sand.

4. Reduced ventilation air requirement for separators.

5. Reduced metallic content in reclaimed sand.

© Wheelabrator Group, Inc.

The achievement of these benefits and the safe and efficient operation of the LP system units are dependent on the complete understanding and proper use of the information in this manual.

3.4.1.3.1 Primary LP Magnetic Separators (See Figure 3-17)

a. A mixture of ferrous abrasive media and sand enters the primary LP magnetic separator unit from an upper screw conveyor and rotary screen.

b. The rotary screen removes oversize contaminants from the mixture and directs this material to a suitable customer provided floor level container through a flexible steel tube.

Note: Overflow material can bypass the system through a separate overflow pipe and be recycled.

c. The ferrous abrasive media and sand mixture that passes through the rotary screen is spread across the width of the separator by the external screw flighting of the rotary screen.

d. This mixture is then metered by a sliding baffle to generate a maximum 3/8 “thick controlled flow of material onto the rotating stainless steel drum.

e. The flowing curtain of material passes between the adjustable burden plate and the rotating drum with its internal hemispherical (215 degree) section alternating pole adjustable magnet system. **[See Figure 3-17 (A-A)]**

f. Alternating pole magnets agitate the mixture of ferrous abrasive media and sand to achieve the maximum release of sand particles and the maximum retention of ferrous particles on the drum surface.

© Wheelabrator Group, Inc.

g. The retained magnetic (ferrous) particles are released from the face of the drum at the end of the magnetic field.

h. The released sand with some magnetic particles passes to the Secondary LP separator.

i. Released metallic particles are directed to the air wash separator section for classification and operating mix control.

j. This uniform curtain of material from the magnetic drum falls onto the sloped surface behind the air wash separator swinging baffle.

k. When the abrasive particles build up to the proper height behind the swinging baffle (and adjustable baffle if so equipped) to overcome the resistance of the counter -weights, the swinging baffle will open and permit a uniform thickness curtain of abrasive to flow over the entire edge of the adjustable lip. **[See Figure 3-17 (B-B)]**

Note: A properly adjusted air wash separator permits only a full width curtain to be presented to the air flow through the separator.

l. This air flow passes between the adjustable lip and the lower adjustable lip.

m. Usable abrasive is directed to a stationary tray screen to capture any oversize material that may have by-passed the rotary screen.

n. Usable abrasive passes through the tray screen into the storage hopper for the blast wheels.

o. The fine metallic waste material and the small amount of sand removed at the air wash separator pass by the lower adjustable lip and drain into a suitable customer provided waste container at floor level.

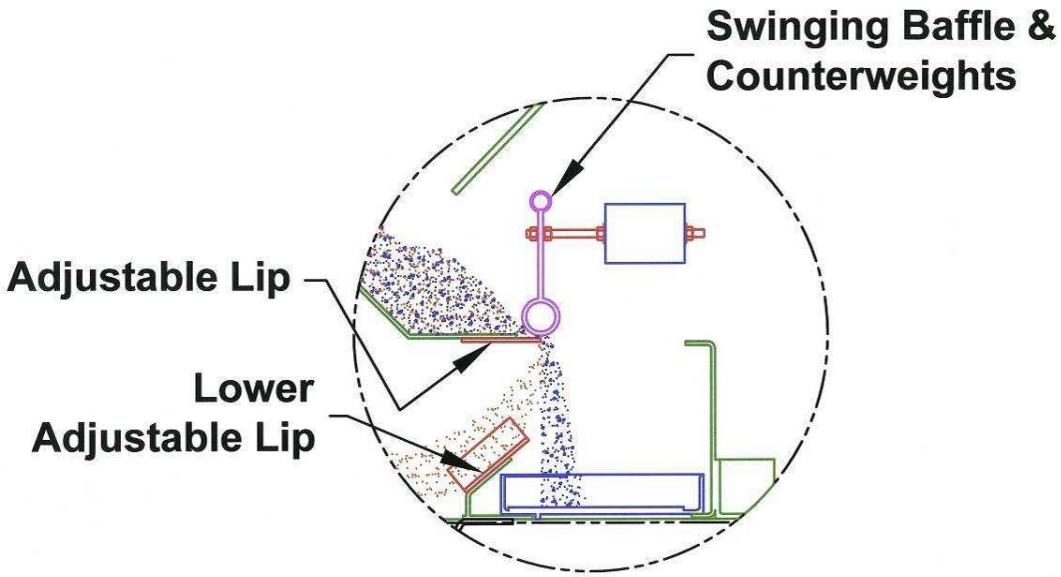
VIEW A-A

Figure 3-17 (A-A)



VIEW B-B

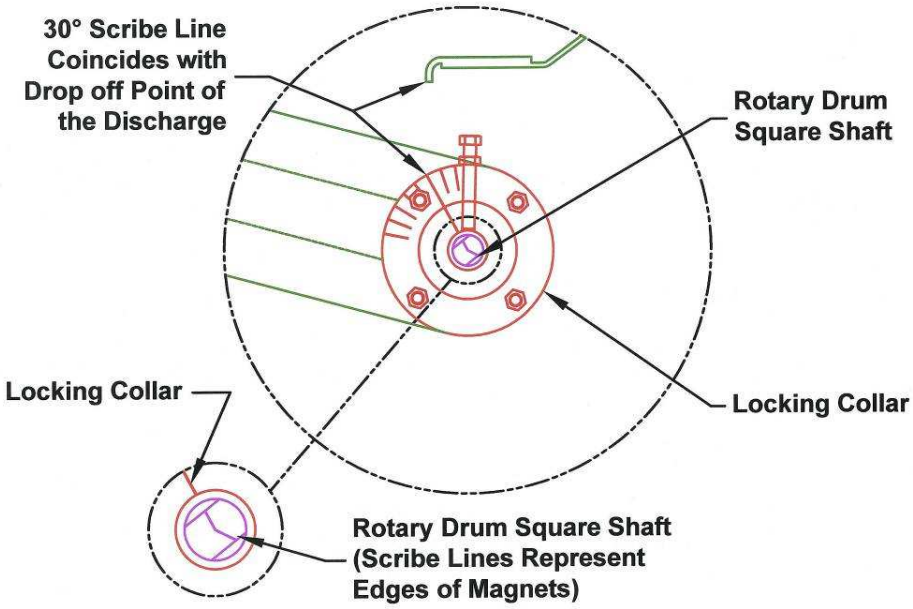
Figure 3-17 (B-B)

© Wheelabrator Group, Inc.

p. Key components will require adjustment to achieve the expected operating efficiency in a safe and reliable manner. **Reference Figures 3-17, 3-17 (A-A) and 3-17 (B-B).**

1. **Sliding Baffle** - The sliding baffle must be positioned to control the thickness of the abrasive and sand mixture from the rotary screen so it flows onto the outer surface of the rotating stainless steel drum without flooding or overloading the magnetic field. **[See Figures 3-17 & 3-17 (A-A)]**

2. **Burden Plate** - keeps the falling mixture of abrasive and sand close to the rotating drum surface and in the magnetic field of the alternating pole magnet system. **[See Figures 3-17 & 3-17 (A-A)]**



Positioning Upper Magnet Edge

Figure 3-18

© Wheelabrator Group, Inc.

3. **Alternating Pole Magnetic Drum** - The magnetic drum system requires proper positioning of the fixed alternating pole magnet inside the rotating stainless steel drum **(Refer to Figure 3-18)**. Using an adjustable wrench on the square end shaft, align the upper end of the scribe mark on the end of the shaft with the longer scribe mark on the face of the locking collar. Record the short scribe mark reference point from the locking collar. This will position the upper magnet edge with the drop off point of the discharge. The initial setting may need further adjustment to use the magnetic field to minimize the impact of the falling abrasive and sand on the drum surface and maintain a good discharge arc for the metallic particles under the drum.

   [See Figures 3-17, 3-17 (A-A) and 3-18]

4. **Swinging Baffle & Counterweights** -The swinging baffle should swing freely but remain closed until sufficient abrasive material builds up behind the baffle to insure the flow of a full width curtain. The air wash will then flow uniformly through the falling material to remove unusable metallic fines and residual non metallic contaminants. The counterweights must be positioned to hold the baffle closed without causing an overflow or partial curtain condition. Make sure the swinging baffle will not stick on the ends near the vertical housing wall. Grind the edges for clearance if required. The vertical back of the swinging baffle should be perpendicular with the edge of the adjustable lip. Use the slotted holes for the bearing mounts to adjust the position of the baffle as required. The bottom edge of the baffle should clear the adjustable lip by approximately 1/8". This gap may change, based on the size abrasive used, to prevent sticking of the baffle on the horizontal lip. Correct clearance allows the baffle to push

© Wheelabrator Group, Inc.

against the build up of abrasive on top of the lip and prevent any partial curtain leakage of abrasive.
[See Figures 3-17 and 3-17 (B-B)]

5. **Adjustable Lip** - can be adjusted along with the swinging baffle adjustment to achieve the position and relationships described in paragraph 4 above.
[See Figures 3-17 and 3-17 (B-B)]

6. **Lower Adjustable Lip** - Establish a minimum gap of ½' between the top front edge of this lip and the back edge of the falling abrasive mix. Additional adjustments of this lip may be required in conjunction with adjustments in air flow through the separator and size, weight & volume of contaminants. An air gap is necessary to allow some horizontal movement of usable abrasive particles as the horizontal air stream carries the lighter weight contaminants and unusable metallic fines out of the abrasive mix.
[See Figures 3-17 and 3-17 (B-B)]

3.4.1.3.2 Secondary LP Magnetic Separators (See Figure 3-19)

a. A mixture of sand with small amounts of metallic particles enters the secondary LP magnetic separator unit from the primary separator discharge pipe/hose.

b. This hose directs the mixture to the top of the separator casing where internal deflector baffles uniformly spread the incoming material out across the width of the separator housing.

© Wheelabrator Group, Inc.

c. The sand and metallic material is allowed to build up in the upper casing to an optimum level for effective operation of the fixed pole magnet system.

d. When the abrasive particles build up to the proper height behind the swinging baffle to overcome the resistance of the counter -weights, the swinging baffle will open and permit a uniform thickness curtain of abrasive to flow over the entire edge of the upper casing.

Note: A properly adjusted swinging baffle permits only a full width curtain to be presented to the magnetic drum through the separator.

e. The flowing curtain of material passes between the adjustable burden plate and the rotating drum with its internal hemispherical (~225 degree) section fixed pole adjustable magnet system.

f. Sand flows directly off the drum into a hopper and then into a discharge container or transporter provided by the purchaser.

g. Metallic particles retained by the magnetic field are released at the rear of the separator unit and pass into a waste metallic container provided by the purchaser.

h. An adjustable angle under the magnetic drum is positioned for effective splitting of the sand and metallic discharge material.

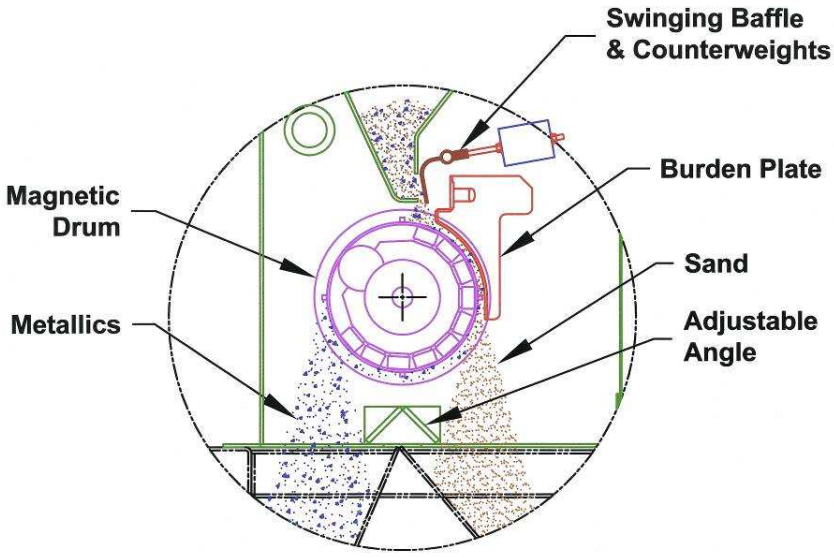
Typical Secondary LP Magnetic Separator

Figure 3-19



View A-A

Figure 3-19 (A-A)

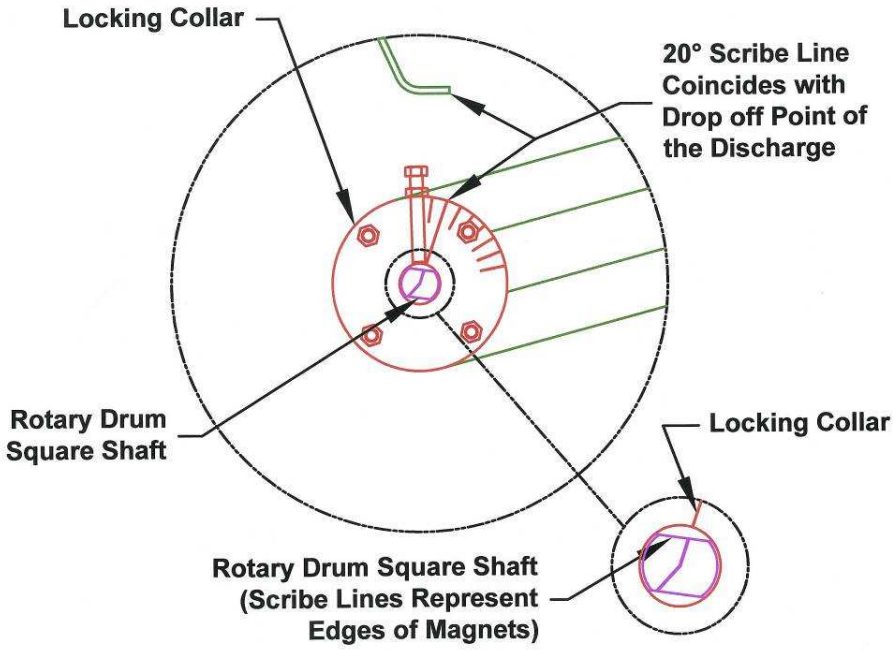
© Wheelabrator Group, Inc.

i. Key components will require adjustments to achieve the expected operating efficiency in a safe and reliable manner. **Reference Figures 3-19, 3-19 (A-A) and 3-19 (B-B).**

1. **Swinging Baffle & Counterweights** -The swinging baffle should swing freely but remain closed until sufficient abrasive material builds up behind the baffle to insure the flow of a full width curtain. The counterweights must be positioned to hold the baffle closed without causing an overflow or partial curtain condition. Make sure the swinging baffle will not stick on the ends near the vertical housing wall. Grind the edges for clearance if required. The vertical back of the swinging baffle should be perpendicular with the edge of the upper casing lip. Use the slotted holes for the bearing mounts to adjust the position of the baffle as required. The bottom edge of the baffle should clear the upper casing lip by approximately 1/8". This gap may change, based on the size abrasive used, to prevent sticking of the baffle on the horizontal lip. Correct clearance allows the baffle to push against the build up of abrasive on top of the lip and prevent any partial curtain leakage of abrasive.
[See Figures 3-19 and 3-19 (A-A)]

2. **Burden Plate** - keeps the falling mixture of metallic particles and sand close to the rotating drum surface and in the magnetic field of the fixed pole magnet system.
[See Figures 3-19 and 3-19 (A-A)]

© Wheelabrator Group, Inc.



Positioning Upper Magnet Edge

Figure 3-20

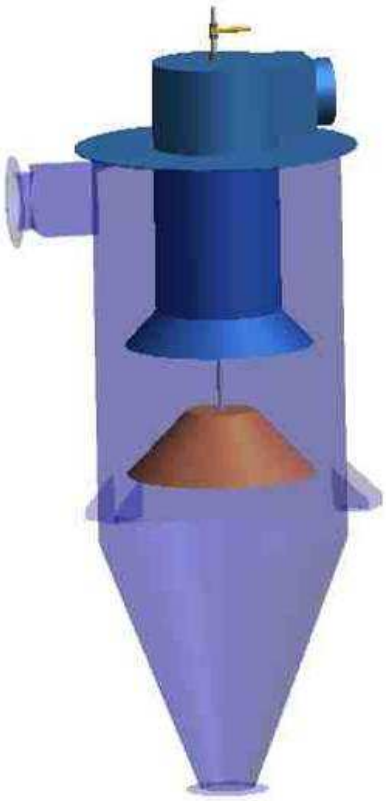
3. **Fixed Pole Magnetic Drum** - The magnetic drum system requires proper positioning of the fixed pole magnet inside the rotating stainless steel drum **(Refer to Figure 3-20)**. Using an adjustable wrench on the square end shaft, align the upper end of the scribe mark on the end of the shaft with the longer scribe mark on the face of the locking collar. This will position the upper magnet edge directly below the discharge lip drop point below the swinging baffle and the lower edge past the lower hopper adjustable angle. This initial setting may need further adjustment to maintain a good discharge arc for the metallic particles under the drum.
   [See Figures 3-19, 3-19 (A-A) and 3-20]

© Wheelabrator Group, Inc.

This top setting will provide immediate attraction to the small quantities of magnetic material mixed in with the sand. The bottom setting insures effective discharge of metallic particles into the waste hopper area.

4. **Adjustable Angle** - The adjustable angle must be located to allow all metallic particles to discharge from the magnetic drum without contaminating the reclaimed sand material. Moving of the angle will be dependent on the results of a screening and magnetic content analysis of the discharged reclaimed sand. **[See Figures 3-19 and 3-19 (A-A)]**

3.4.1.4 Cyclone Separator (Figure 3-21)



Typical Cyclone Separator
Figure 3-21

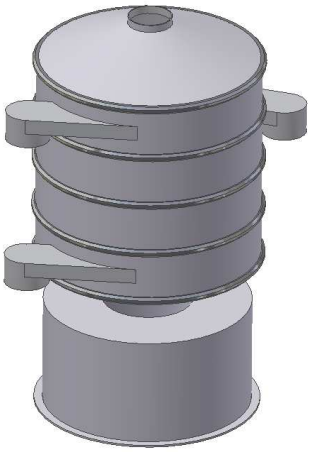
© Wheelabrator Group, Inc.

a. Dusty air form the surface preparation process enters the Cyclone tangentially at it's inlet at the top portion. The air along with abrasive media and dust particles swirl around the Cyclone insides, travelling towards the bottom along the walls (Cyclones come with a suitable lining on the interior walls to reduce wear). Heavy particles in the stream, mainly consisting of usable abrasive media separate from the stream at the bottom of the cyclone.

b. An inner concentric tube in the Cyclone, with its opening at the bottom portion of the Cyclone is provided for passage of air stream with fine dust particles moving towards the top, to the dust collector.

c. The opening to this inner tube is fitted with a tuning cone having a threaded stem extending through the top of the Cyclone for vertical adjustment of the cone. Air velocity inside the Cyclone is increased by closing the gap between the inner tube and the tuning cone. Similarly the velocity can be decreased by increasing the gap between the two.

3.4.1.5 Vibratory Classifiers (Figure 3-22)



Typical Cyclone Separator
Figure 3-22

© Wheelabrator Group, Inc.

a. The primary function of the Vibratory Classifier is to remove oversized contaminants, broken or small abrasive media, and any other undersized contaminants that may be in the abrasive media mix.

b. The nature of the application determines the number of "Screens" in the Vibratory Classifier, each screen between the first and last screen is only in place to remove a particular size of abrasive from the next screen down. This may be required in Peening applications which use multiple abrasive media sizes.

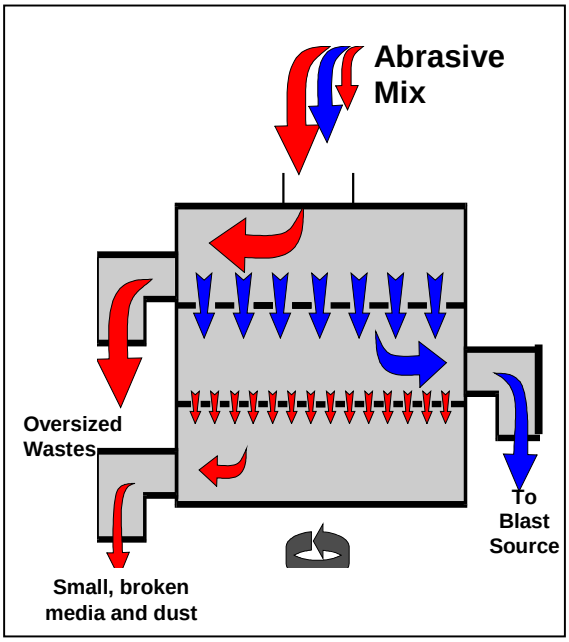


Figure 3-23

c. In **Figure 3-23**, a two screen Vibratory classifier is illustrated. The first screen is designed to remove all oversized materials from the abrasive media mix and discharge them to a waste receptacle. Allowing only smaller of particles to pass through up to a specific size.

d. The Abrasive that does not pass through the second screen is considered the usable size and is discharged to the storage hopper or the blast source.

© Wheelabrator Group, Inc.

e. Anything passing through the second screen is also considered waste and discharged to a waste receptacle.

Note: Holes of any size in the separator screens are not acceptable. If a hole develops or a screen is torn it needs to be replaced immediately. Consult the manufacturers supplement, regarding screen replacement procedures.

The Vibratory Classifier is pre-set from the factory for its motion. Any adjustment in the Vibratory Classifier must be done in full compliance with the written instructions of the Vibratory Classifier manufacturer.

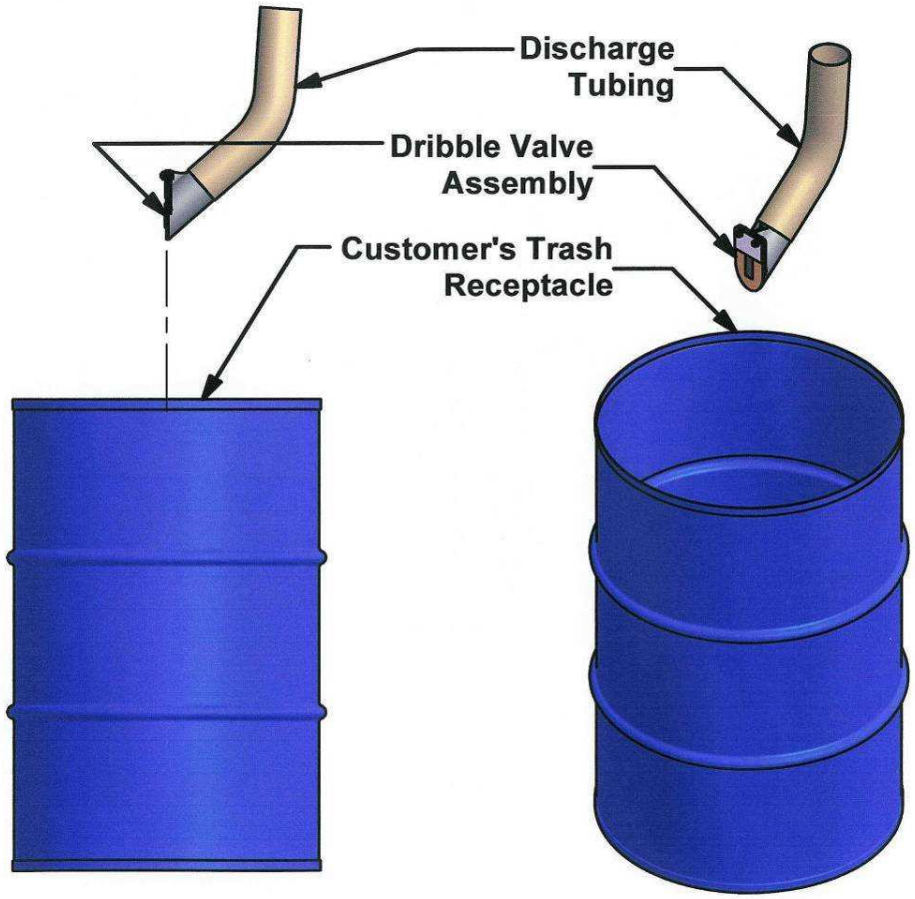

Figure 3-24

3.5 Function of a Dribble Valve

See Figure 3-24

The dribble valve prevents air flow up the separator discharge tube and allows sand, scale and fines to flow to customer's trash receptacle.

© Wheelabrator Group, Inc.

3.5.1 Mounting and locating dribble valve

See Figure 3-24

1. Dribble valve should be positioned with rubber flap vertical.
2. Dribble valve should be positioned over customer's trash receptacle above the trash angle of repose to prevent material backing up into the tubing.
3. Secure trash discharge tubing to dribble valve with screws.

3.6 Function of an Abrasive Media Storage Hopper

a. Abrasive storage hopper collects and stores the abrasive media during cleaning cycles and when equipment is not operating.

b. The holding capacity of the storage hopper is designed so that when all the blast wheel units are running and the abrasive media has reached a state of equilibrium there remains sufficient reserve capacity to prevent starving the wheel and to protect the hopper from wear.

c. Storage hoppers are equipped with a hand hole cover to facilitate mounting of the feed line parts and for clean out. This opening is usually mounted on a vertical wall on the hopper.

Do not remove hand hole covers in hopper without safely discharging of abrasive storage hopper contents.

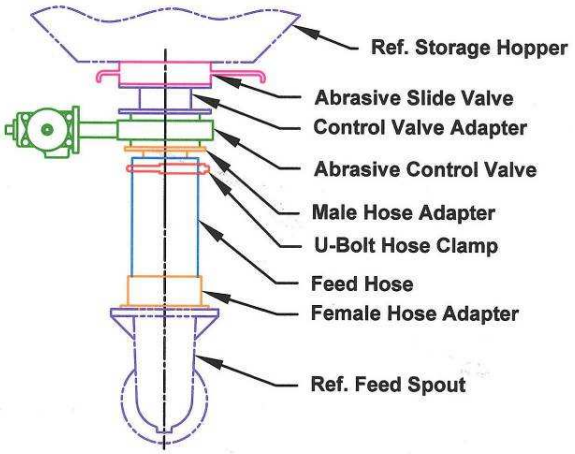
3.7 Function of an Abrasive Controls Assembly

a. The abrasive controls assembly regulates the feed of abrasive media between the storage hopper and the blast wheel.

b. Adjustable abrasive control valves are provided to regulate the flow of abrasive to the wheels. An air cylinder or magnetic control unit opens and closes each valve. Cylinders are adjustable to obtain the specified flow with different types and sizes of abrasive. Magnetic

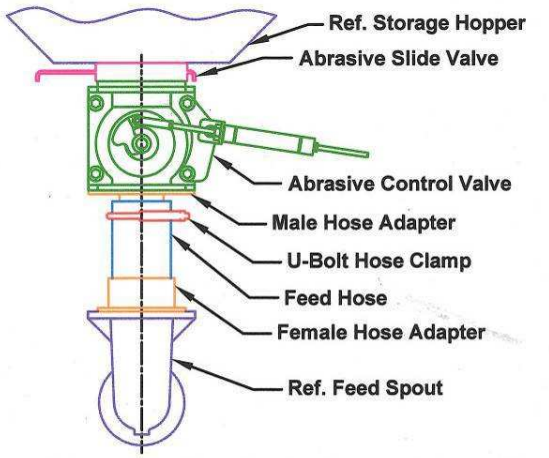
© Wheelabrator Group, Inc.

controls provide variable flow adjustment. This meters the abrasive from the storage hopper to the wheels.



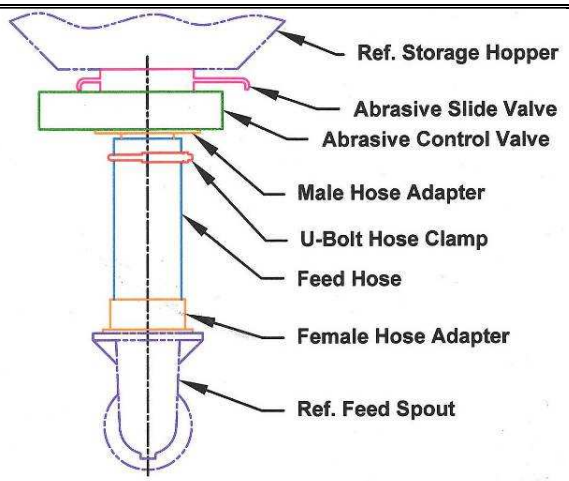
Abrasive Controls Assembly with Butterfly Type Abrasive Control Valve

Figure 3-25



Abrasive Controls Assembly with Dipper Type Abrasive Control Valve

Figure 3-26



Abrasive Controls Assembly with MagnaValve Type Abrasive Control Valve

Figure 3-27

© Wheelabrator Group, Inc.

c. The following are common components of a typical abrasive controls assembly as shown in **Figures 3-25**, **3-26** and **3-27**.

1. **Abrasive Slide Valve** - This is a manually operated slide valve to open or close the media flow from the storage hopper to the blast wheel. This valve makes it possible to close off the flow of media to perform repairs and maintenance on the abrasive controls system with have to drain the storage hopper.

Do not use slide valve to meter abrasive media flow.

2. **Abrasive Control Valve** - This meters the abrasive from the storage hopper to the wheels. There are three (3) types of abrasive control valves.
[See Figures 3-25, 3-26 and 3-27]

   - **Butterfly Type** - An air cylinder opens and closes a wafer type paddle valve. The cylinder is adjustable to obtain the specified flow with different types and sizes of abrasive.
   - **Dipper Type** - An air cylinder opens and closes a totally enclosed dipper cup type valve. An adjustable stop, with coarse and fine adjustments, on the valve controls where the cylinder stops to obtain the specified flow with different types and sizes of abrasive.
   - **MagnaValve Type** – This valve is a normally closed magnetic valve suitable for regulation of steel shot and grit. The valve construction includes a permanent magnet for normally closed operation and an electromagnet for controlling shot flow rates. By regulating the voltage to the electromagnetic any desired flow rate may be achieved. When power is off, the valve will hold shot due to the permanent magnet.

3. **Male Hose Adapter** – This is used to attach rubber hose type feed lines to the abrasive control valve.

4. **U-Bolt Hose Clamp** – this secures the rubber hose type feed line to the hose adapter.

© Wheelabrator Group, Inc.

5. **Feed Hose** – This conveys the abrasive media from the abrasive control valve to the blast wheel. There are two (2) types of feed lines.
   - **Abrasive Resistant Rubber Hose** – This consists of abrasive resistant rubber hose and is the most common feed line type. It is flexible and easy to install.
   - **Hard Piping** – This consists of a network of hard pipe and weld elbows to feed the wheels.
6. **Female Hose Adapter** - This is used to attach rubber hose type feed lines to the feed spout of the blast wheel.

Section 4 Ventilation

A properly sized and efficiently operating dust collector system is required for effective control of dust and separation and collection of broken down abrasive media and contaminants generated by the blasting action. See **Figure 4-1** for typical ventilation arrangement.

Each ventilation point requires a specific volume and velocity of air to keep particulates suspended in the air stream; avoid dusting at the machine and provide adequate separation of contaminants. A reduction in surface preparation effectiveness and gradual process degradation will occur without proper ventilation.

After effective operation of ventilation system has been confirmed, air volume and velocity readings should be taken at each vent point and recorded as the standard. Periodic checks should be made to watch for changes in these readings that would indicate potential ventilation problems.

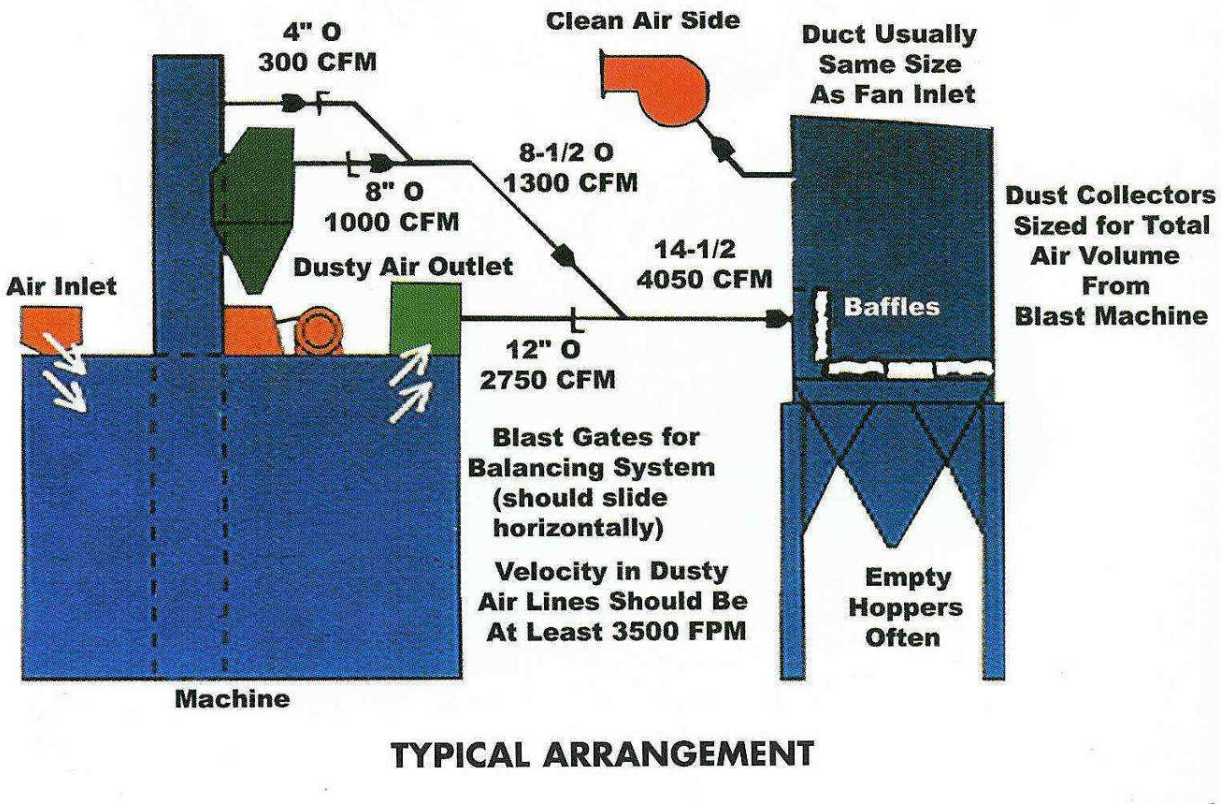

Figure 4-1

© Wheelabrator Group, Inc.

4.1 Dust Collectors

Dust collectors provide three very important functions related to the clean and efficient operation of a blast cleaning machine.

1. The dust collector exhaust fan maintains a steady air flow through the separator, required for the air wash operation. The air flow pulls dust, fines and other contaminants from the thin curtain of abrasive media that falls over the lip of the separator. Operating properly, a dust collector will take out only unusable fines.

2. The dust collector exhauster provides a negative pressure in the blast cabinet. This is needed to keep dust from puffing out of the blast machine. The puffing effect is caused by the air pump action from blast wheel units.

   By creating a negative pressure and controlling the flow of air to the dust collector, air outside the cabinet is dawn into the cabinet, rather than air and dust inside the cabinet being forced out.

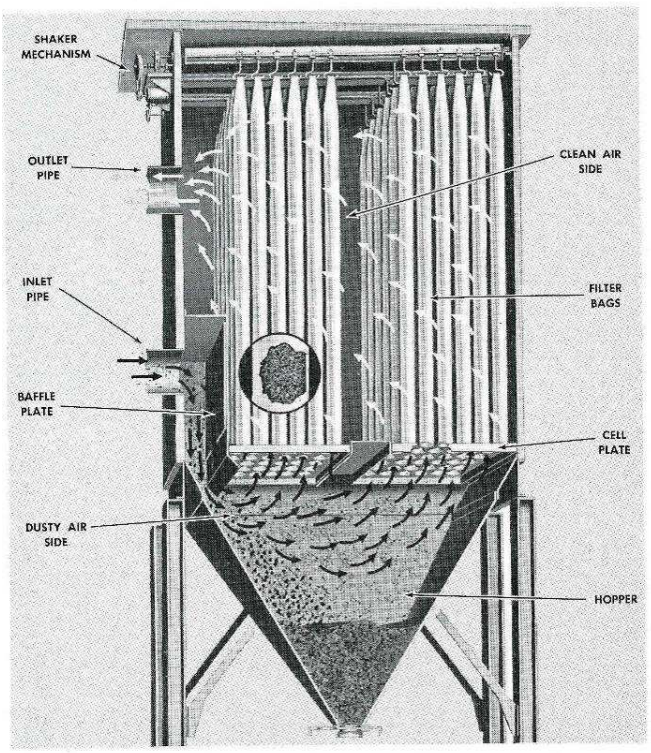
3. The dust collector retains the fine particles, which otherwise would be exhausted to the atmosphere and cause a potential air pollution problem. Because of the potential environmental problems created by dust and the need for good plant housekeeping and good community relations, it is necessary for all blast equipment to be operated with an efficient dust collector system.

© Wheelabrator Group, Inc.

4.2 Three Types of Dust Collectors

4.2.1 Shaker Bag Style

The shaker bag style dust collector is an intermittent duty, automatic or manual shaker type unit. Its construction incorporates multiple tubular bags with internal access required for maintenance and inspections. Dust particles are captured on the inner surfaces of the inflated bags when the fan is operating. Bags may be made of various fabrics with the most common being cotton sateen or polyester for blast equipment applications. Incoming air is diverted by a baffle and slowed via expansion into the hopper. Large contaminants drop into the hopper and finer material is collected on the inside of the bags. Cleaning is performed by stopping the fan to allow the bags to go slack before shaking them for a specific interval, usually about three minutes. This action removes most of the dust from the inner surface of the bags so the dust can then fall into the hopper. See **Figure 4-2** for Typical Shaker Bag Style Dust Collector.

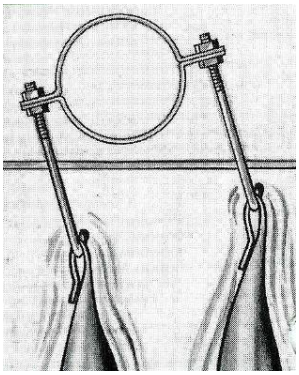


Typical Shaker Bag Style Dust Collector
Figure 4-2

© Wheelabrator Group, Inc.

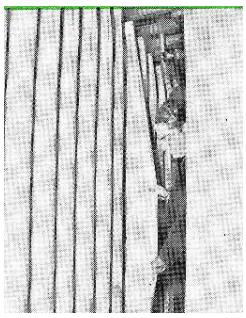
4.2.1.1 Elements of a Typical Shaker Bag Style Dust Collector:

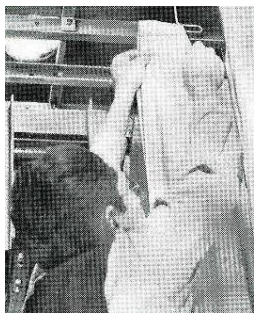
4.2.1.1.1 Shaker Mechanism



Dustubes are cleaned by the gentle but highly efficient motion of the shaker mechanism which is driven by a totally enclosed motor located at the clean air side or outside the dust collector. The shaker provides a gentle wave-like action from top to bottom of each bag. The motion is similar to the action obtained by hand shaking a rug.

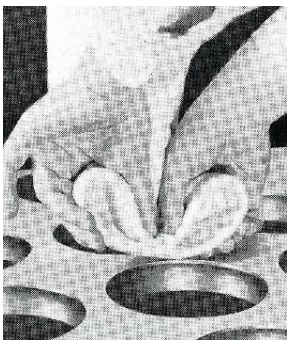
4.2.1.1.2 Filter Bags





Filter bags are usually made of cotton sateen fabric, making them inexpensive cloth filters. No metal contacts the filtering area of the cloth filter bags.

4.2.1.1.3 Cell Plate



The cell plate retains the bottom or open end of the filter bags that features a sewed-in ring-type spring. This end is folded in half and inserted through a cell plate hole for installation (see picture). When pressure on the hoop spring is released, the tube snaps into place, providing an instant, positive seal with the cell plate surface.

© Wheelabrator Group, Inc.

4.2.1.1.4 Inlet Vent

The dust-laden air enters the dust collector from the equipment vent piping through the inlet vent as shown in **Figure 4-2**.

4.2.1.1.5 Baffle Plate/Liner

The dust-laden air entering the dust collector strikes the baffle plate/liner where the sudden change in direction and reduction in air velocity cause heavier particles to drop out immediately into the hopper. All materials large enough to wear the filter fabric drop out of the air stream so only the small dust particles reach the filter bags as shown in **Figure 4-2**.

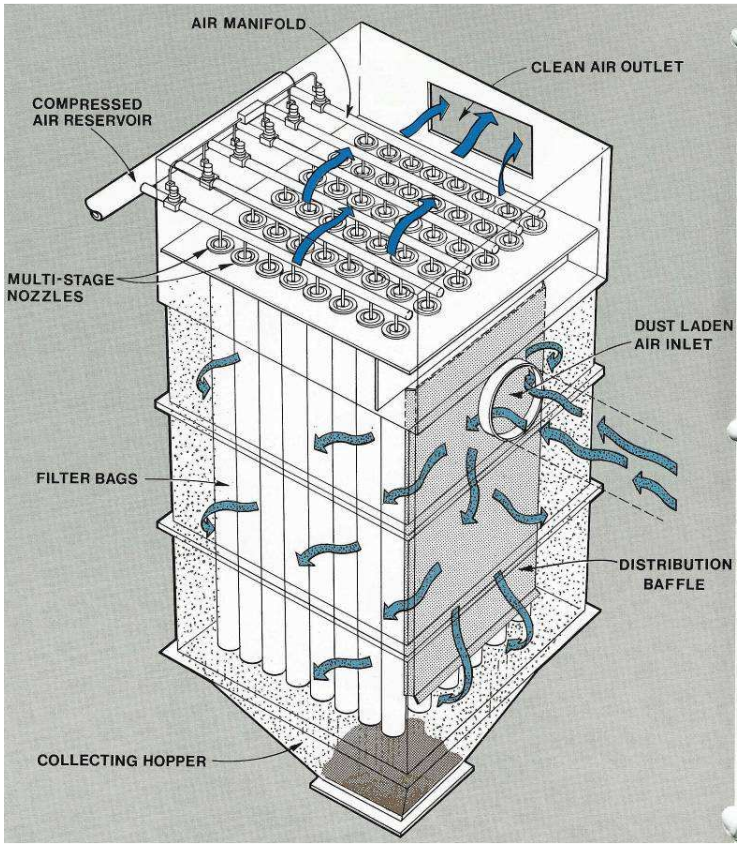
4.2.1.1.6 Fan Outlet Vent

The cleaned air from the dust collector is exhausted through the fan outlet vent to the atmosphere as shown in **Figure 4-2**.

© Wheelabrator Group, Inc.

4.2.2 Pulse Bag Style

The pulse bag dust collector is a continuous, automatic, pulse-type unit. Its construction incorporates multiple tubular bags supported by tubular steel wire cages. Access may be from outside or from an integral enclosure on the roof. Dust particles are effectively captured on the outer surface of the tubular bags as the air flows through the material into the center of the cage frames. The bags may be made of various fabrics with the most common being cotton sateen or polyester for blast equipment applications. Cleaning is performed by various venturi systems using periodic metered pulses of high pressure air down the center of the wire cages. This reverse air pulse halts the inflow of air and releases the collected dust from the outer surface of the bags. Each pulse sequence frees the dust particles to work their way down the bags and into the hopper.



Typical Pulse Bag Style Dust Collector

Figure 4-3

© Wheelabrator Group, Inc.

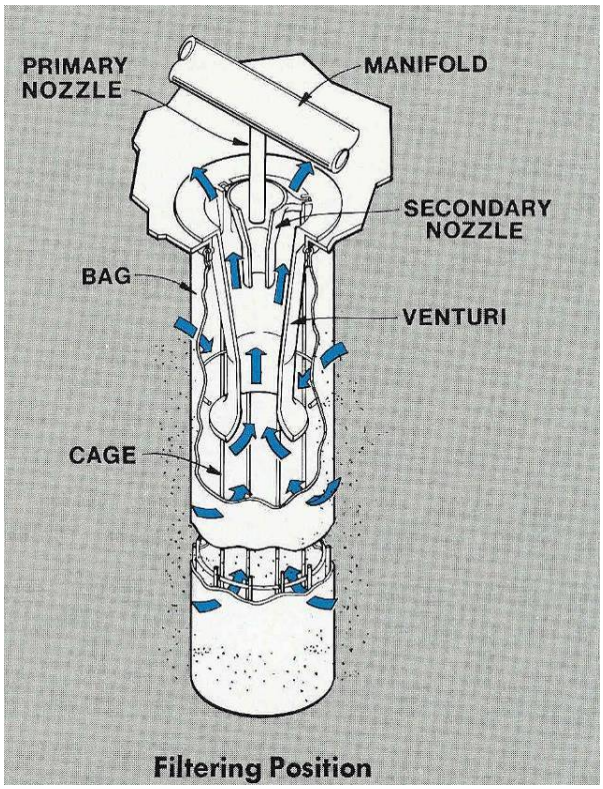


Figure 4-4

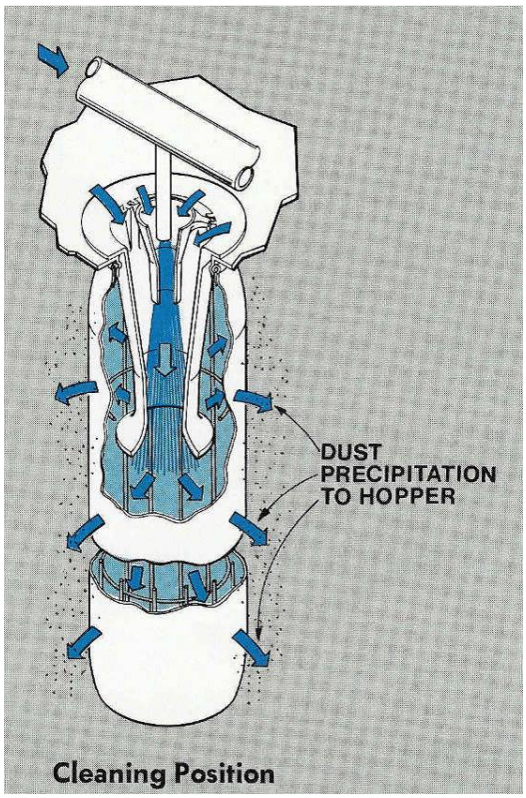

Figure 4-5

4.2.2.1 Elements of a Typical Pulse Bag Style Dust Collector:

4.2.2.1.1 Inlet Vent

The dust-laden air enters the dust collector from the equipment vent piping through the inlet vent as shown in **Figure 4-3**.

4.2.2.1.2 Baffle Plate/Liner

The dust-laden air entering the dust collector strikes the baffle plate/liner where the sudden change in direction and reduction in air velocity cause heavier particles to drop out immediately into the hopper. All materials large enough to wear the filter fabric drop out of the air stream so only the small dust particles reach the filter bags as shown in **Figure 4-3**.

© Wheelabrator Group, Inc.

4.2.2.1.3 Filter Bags

Filter bags are supported by tubular steel wire cages see **Figures 4-4** and **4-5**. The bags may be made of various fabrics with the most common being cotton sateen or polyester for blast equipment applications.

4.2.2.1.4 Compressed Air Reservoir

The compressed air reservoir stores compressed air to insure minimum pressure drop and maximum air storage for each valve. (See **Figure 4-3**)

4.2.2.1.5 Air Manifold

The air manifold distributes the air from the compressed air reservoir evenly to the multi-stage nozzles to clean the filter bags. (See **Figure 4-3**)

4.2.2.1.6 Multi-Stage Nozzles

A controlled blast of compressed air is released from the primary nozzle into the secondary nozzle located in the throat of the venturi nozzle. The volume of air is magnified by the addition of the secondary and tertiary air being drawn into the dust-laden filter bag. (See **Figure 4-4**)

This sudden release of energy into the filter bag causes it to instantly expand to its maximum diameter throwing the dust off the outer surface. As soon as the cleaning energy is spent the bag returns to its normal filtering position and the now airborne dust falls to the collection hopper with an assist from the downward air patterns.

4.2.2.1.7 Venturi

The Venturi cone, as shown in **Figures 4-4** & **4-5**, helps funnel the pulsed air from the manifold header into the center of the filter bag and cage.

© Wheelabrator Group, Inc.

4.2.2.1.8 Fan Outlet Vent

The cleaned air from the dust collector is exhausted through the fan outlet vent to the atmosphere as shown in **Figure 4-3**.

4.2.3 Cartridge Style

A cartridge style collector is a continuous, automatic, pulse-type unit. Its construction offers a compact design with ease of servicing. Dust particles are effectively captured on the outer surfaces of cartridge filter elements made of various materials appropriate to the individual applications. Cleaning is performed by various venturi systems using periodic metered pulses of high pressure air into the center of the cartridges. This reverse air pulse halts the inflow of air and releases the collected dust from the outer surface of the cartridge. Each pulse sequence frees the dust particles to work their way down the side of the cartridge into the waste hopper and container. (See **Figure 4-6**)

Typical Cartridge Style Dust Collector

Figure 4-6

© Wheelabrator Group, Inc.

4.2.3.1 Elements of a Typical Cartridge Style Dust Collector:

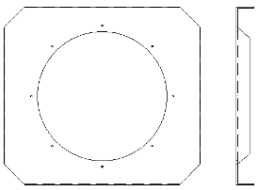
4.2.3.1.1 Inlet Vent

The dust-laden air enters the dust collector from the equipment vent piping through the inlet vent.

4.2.3.1.2 Baffle Plate/Liner

The dust-laden air entering the dust collector strikes the baffle plate/liner where the sudden change in direction and reduction in air velocity cause heavier particles to drop out immediately into the hopper. All materials large enough to wear the filter fabric drop out of the air stream so only the small dust particles reach the cartridge filters.

4.2.3.1.3 Typical Cartridge with Clamping Plate



The cartridge clamping plate as shown here in this sketch is attached to the cartridge filter as shown in this picture. This enables it to be clamped into the tube sheet with the cartridge clamp assembly.

4.2.3.1.4 Typical Cartridge Filters w/o Clamping Plate

The dust collector cartridge filter as shown here is composed of cellulose pleated filter with reinforced polyester screen inside and outside encasement.

© Wheelabrator Group, Inc.

4.2.3.1.5 Compressed Air Reservoir

The compressed air reservoir stores compressed air to insure minimum pressure drop and maximum air storage for each valve.

4.2.3.1.6 Air Manifold

The air manifold distributes the air from the compressed air reservoir evenly to the multi-stage nozzles to clean the filter bags.
Note: Similar to **Figure 4-3**

4.2.3.1.7 Nozzles

A controlled blast of compressed air is released from the nozzle into the throat of the venturi nozzle. The volume of air is magnified by the addition of the secondary and tertiary air being drawn into the dust-laden cartridge filter.

4.2.3.1.8 Typical Venturi

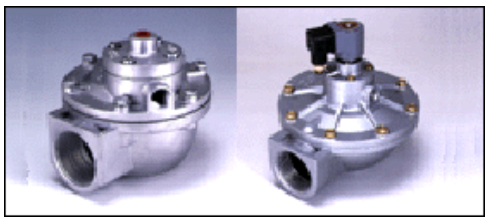
The Venturi cone shown here helps funnel the pulsed air from the cartridge header into the center of the cartridge filter element. The venturi is dropped into the filter element before clamping and installing the filter element into the tube sheet in the dust collector chamber.

4.2.3.1.9 Fan Outlet Vent

The cleaned air from the dust collector is exhausted through the fan outlet vent to the atmosphere.

© Wheelabrator Group, Inc.

4.3 Diaphragm Valve used on Pulse Bag & Cartridge Style



The reverse pulse diaphragm valve delivers a short high pressure pulse of compressed air, reversing the air flow through a cartridge filter or filter bag. This action removes particulate from the filter surface, allowing the dust to fall towards the dust hopper.

The valve relies on system pressure acting on a flexible diaphragm membrane to maintain a closed condition against the valve seat. The pressurized cover chamber above the diaphragm is exhausted when an electrical signal is supplied to the solenoid operator of the direct pilot operator (CA). This lowers the pressure differential about the diaphragm and allows the diaphragm to lift off the valve body seat. Compressed air is discharged through the valve outlet. When the electrical signal is switched off the valve exhausts are closed, the pressure differential is balanced by air bleeding from the body to cover the chamber and the diaphragm membrane moves back onto the valve body seat shutting down the sir flow.

4.4 Pressure Gages used on All Three Styles of Collectors

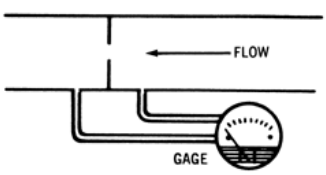
4.4.1 Manometer Unit

The manometer is a U-tube type to measure air pressure drop across the dust collector filter elements and indicates a need for cleaning or replacement of filter elements. The manometer should be mounted at a convenient height for reading vertically on dust collector and it must be level.

© Wheelabrator Group, Inc.

4.4.2 Magnehelic® Differential Pressure Gage

The Magnehelic gage gives a continual reading of the differential air pressure across the dust collector filter elements for monitoring the build up of dust and the need for cleaning or replacement of filter elements.



4.4.3 Photohelic® Differential Pressure Gage

The Photohelic pressure cage gives a continual reading of the differential air pressure across the dust collector filter elements and electronically controls the cleaning cycle for the dust collector

4.5 Exhaust Piping Construction

The gauge/thickness of material used to fabricate vent piping is critical to the effective life and performance of the vent piping system. Duct routing and intersecting duct construction methods must be compatible with the highly abrasive particulates being carried in the air stream. Follow appropriate guidelines for construction of your exhaust piping system.

Contact your blast equipment supplier for copies of the recommended exhaust piping construction information.

© Wheelabrator Group, Inc.

© Wheelabrator Group, Inc.

Section 5 Maintenance

5.1 Inspection, Repair/Replacement of Parts & Components

For the blast equipment to perform efficiently, periodic inspection and preventive and predictive maintenance must be accomplished through a regular maintenance program, “Have a Good program and Practice It.” The purpose of this program is:

1) To detect minor necessary repairs and prevent major ones.

2) To anticipate repairs by locating probable causes – i.e., preventive maintenance.

3) To plan repairs for convenient times (predictive maintenance).

4) To prevent breakdowns.

5) To be certain that the machine is being operated safely and at the highest possible efficiency level.

6) To keep an accurate record of maintenance activity and replacement parts usage in order to manage the spare parts inventory and monitor operating and maintenance costs.

CAUTION: When performing inspection and maintenance on the machine, electric power must be disconnected and safety glasses and gloves should be worn.

The components of the machine which require periodic inspection and eventual repair/replacement include, but are not limited to, the following:

5.1.1 Blast Wheel Assembly

A basic inspection of the wheel assembly can be made by removing the top cover and top liner and then looking inside the assembly while slowly rotating the bladed-wheel manually. Removing the components from the housing will permit a more detailed inspection. Refer to Section 6.1 Troubleshooting for blast wheel assemblies malfunctions and suggested remedies.

© Wheelabrator Group, Inc.

5.1.1.1 Liners

The liners should be inspected and replaced before any holes are worn through. All liners are easy to replace. When installing liners in the wheel housing, it is vitally important that the liner pieces fit up against one another as tightly as possible to minimize housing wear from the blast.

5.1.1.2 Wheel Housing

During replacement of liners, the housing should be inspected for wear. A defective housing should be repaired or replaced promptly to prevent the escape of abrasive media.

5.1.1.3 Wheel Blades, Control Cage & Impeller

The wheel parts should be inspected at the same time that liner inspection is made. Parts should be replaced when worn in accordance with the following criteria:

One of the main objects of wheel assembly inspection and maintenance is to keep the wheel in balance. Severe vibration can be a major cause of motor bearing failure.

The most frequent cause of vibration is worn, chipped or broken wheel blades. Wear on the wheel blades varies greatly from one installation to another. Blade life is dependent on various operating conditions. Although the wheel blades may be wearing evenly and may not be causing any abnormal vibrations, blades should be replaced before wearing half-way through. Holes in the wheel blade surfaces will cause wear on other parts and disrupt the blast pattern.

The edge of the control cage opening and impeller openings will eventually wear and this wear must not be allowed to exceed 1/8” for the impeller and 1/4” for the control cage before replacement. The effect of wear will move the blast pattern and this in turn will cause wear on the machine structure and reduced cleaning of the work.

© Wheelabrator Group, Inc.

To replace the control cage and impeller, remove the feed spout and control cage clamps. Remove impeller cap screw and impeller. Withdraw the control cage and fit the new one, make sure that the opening of the new control cage is replaced in exactly the same position as the old one. Re-clamp and replace the impeller and feed spout.

5.1.1.4 Removal and Replacement of Blast Wheel Impeller Bolt

When removing and/or replacing the impeller cap screw, it is very important that the following procedure be implemented to prevent wheel parts from coming loose and a wheel failure from occurring. This pertains to all blast wheels containing a threaded insert in the wheel shaft.

After removing impeller cap screw from the wheel assembly, check the threaded insert in the wheel shaft to assure that it is fully seated (below the surface of the end of the shaft). If the insert screws out of the shaft when removing the impeller cap screw, **replace both the cap screw and threaded insert. Do not reuse the threaded insert that has been removed from the shaft.** If the threaded insert must be reused, apply loctite #242 thread locker (or equal) to the external threads of the insert prior to reinserting.

It is very important that the threads of the cap screw and the threaded insert be clean and free of abrasive contaminants. Prior to reinserting cap screw, use an air hose to remove contaminants. (Comply with O.S.H.A. regulations for use of compress air for cleaning.)

Make sure the centering plate is correctly positioned on the hub/wheel drive pins and the impeller is securely locked in the centering plate slots when assembled. Use **only** the special impeller bolt hi-collar lock washer, listed on your wheel assembly drawing. **Do not** assemble with a standard lock washer. Tighten the impeller cap screw to 100 ft/lbs of torque.

Ez-lock insert number 329-12 Wheelabrator part number 294212.

© Wheelabrator Group, Inc.

5.1.2 Blast pot

At regular inspection intervals, the Blast pot, valves, piping and hoses should be checked for wear. Refer to manufacturers recommendations found in Media Delivery Addendum and follow the inspection list found in Section 5.

5.1.2.1 Reclaim Ducting: (Vacuum Recovery)

a. When a vacuum system is used as the transport for abrasive media in a surface preparation system, the common component requiring maintenance is the Reclaim Ducting.

b. The primary function of the Reclaim ducting is to transport the spent abrasive media and other finer materials from the Blast cabinet to the next stage of abrasive separation; typically this is a Cyclone separator.

c. Only visual inspection can be performed on the Reclaim duct, to ensure no leaks or worn areas have occurred. The design of the system itself is intended to minimize wear, unfortunately due to the nature of abrasive wear will occur.

d. Inspect joints between elbows and straight sections on a monthly basis. Repairs for leaking air can be made using duct tape.

e. Inspect for wear on elbows on a weekly basis. Wear on elbows is usually where the first signs of wear appear. Replace ducting components as needed.

Note: The wear on these components is not linear; it increases exponentially and must be addressed sooner rather than later.

© Wheelabrator Group, Inc.

5.1.3 Cabinet Assembly

At regular inspection intervals, the inside surfaces of the cabinet should be inspected to detect any wear points that could lead to structural damage or abrasive leakage. If abnormal wear occurs, immediate action should be taken to determine the cause and make necessary repairs/replacement. All liners should be inspected and replaced before any holes are worn through. Any worn or damaged components should be replaced to prevent structural damage and leakage of abrasive.

5.1.4 Work Conveyor Assembly

Regular inspection should be given to the work conveyor structure, bearings, and alignment.

5.1.5 Work Conveyor Drive Assembly

The work conveyor drive should be checked for alignment and proper operation. The gear motor should be checked for oil level. If required, refer to gear motor's instruction sheet in Commercial Parts Manuals, Section 10 for proper lubricant. Refer to Section 8, Paragraph 8.2 for recommendations on lubricating machine components.

5.1.6 Abrasive Recycling System

The abrasive recycling system, cleans the media, removes fines from the abrasive, conditions and returns the reusable abrasive to the wheel, and is designed to adequately handle the abrasive load requirements of the machine.

The components of the abrasive recycling system are subjected to wear and damage due to their contact with abrasive material. Regular inspection of the abrasive recycling system components will help detect any wear, physical damage, or component failures. Check the following frequently:

© Wheelabrator Group, Inc.

5.1.6.1 Abrasive Hopper

Inspection of the sloping sides of the hopper should be made at regular intervals to detect any wear points. Immediate repair/replacement of sections worn away or damaged is necessary to minimize loss of abrasive and any disruption in cycling of the abrasive. Periodically, clean the hopper screen of accumulated objects and debris.

5.1.6.2 Elevator Belt Assembly

The elevator belt assembly should be checked for wear or damage to the belt, worn or damaged buckets, proper tension of the belt and proper alignment on the head pulley. Normally, a new belt assembly is required to replace a worn or damaged elevator belt assembly.

Buckets are the bolt-on type and easily replaced. Check condition of bolt heads for damage and wear. Badly worn bolt heads can lead to the buckets pulling off of the belt. All buckets should be inspected periodically for wear or damage. They should be replaced when the front lip of the buckets wear down 3/4 inch.

After a long period of use, the stretching of the rubber belt may cause the belt take-up arrangement to become ineffective, making it necessary to shorten the belt. Remove the side panel located at the bottom section of the elevator in front of the boot pulley for access to the belt and its splice. Make sure that the head pulley is lowered to its lowest position. Undo the belt splice. By measurement, cut off the excess length and punch new holes in the belt for reconnection. Use a belt puller while making the splice. This will result in a tight belt and allow ample take-up for future needed belt tension. Retighten the belt by the take-up screw at the head section.

© Wheelabrator Group, Inc.

When a worn elevator belt needs replacement, remove the elevator side panel at the boot of the elevator to undo the splice and carefully take out the old belt. You may use the old belt to help pull in the new belt if desired. See note below. Since every belt is “tailor” fitted to each individual elevator assembly, the new belt supplied will probably be 4” to 8” longer than needed. To determine the correct belt length required, measure the distance of the path of the belt around both top and bottom pulleys. Make sure that the head pulley is lowered to the lowest position at the time of measurement. Cut-off must be square. This will result in a tight belt to begin with and allow ample take-up for future needed tension. After the belt is cut, punch in the holes for the splice and bolt the splice on one end of the belt only.

Note: While the belt is out of the machine, inspect the boot pulley and head pulley and bearings for wear or damage. Replace any defective parts. The belt assembly can be fed into the elevator housing through the bottom panel opening and pulled up and over the top pulley (use the old belt or rope wrapped over the top (head) pulley), making sure that the buckets are headed in the proper direction for discharge of abrasive into the elevator from the top and fed down the sides of the head pulley. After the belt is “hung” on the top pulley, pass one end of it under and around the boot pulley and complete the belt splicing by using a belt puller while making splices.

Proper belt tension can be judged by making the following observations:

A. The boot pulley should rotate constantly without slipping or hesitation.

B. The unloaded belt should run generally on the center of the elevator pulleys with a minimum of movement from side to side. The elevator buckets should not strike the sides of the housing.

C. It should be difficult to manually slide the elevator belt back and forth across the face of the boot pulley when the elevator is stopped. The tension of the elevator belt,

© Wheelabrator Group, Inc.

however, should not be so great that there is danger of tearing out the splice.
Belt tension can be adjusted by the screw take-up arrangement at the head section of the elevator. The head pulley can be raised or lowered, within the mechanical take-up limits, by the take-up bolts.

Inspection of the elevator belt alignment is very important. If the belt is permitted to run off center and rub against the elevator housing, the abrading action will eventually damage the elevator housing and belt. Also, an overload is put on the drive motor, which may cause the overload relays to kick out. A take-up screw is provided on each side of the head shaft for maintaining proper alignment. When aligning the elevator belt, make only a slight adjustment at a time, raising the head shaft on the side toward which the belt is riding. Using caution and keeping hands away from top opening, the top cover plate can be removed to permit viewing the belt alignment on the head pulley while the belt is running. Refer to Section 9 “Troubleshooting” for elevator malfunctions and suggested remedies.

5.1.6.3 Elevator Drive

The gear motor for the elevator drive should be checked for oil level. If required, refer to gear motor’s instruction sheet in Commercial Parts Manuals, Section 10 for proper lubricant. Refer to Section 8, Paragraph 8.2 for recommendations on lubricating machine components.

5.1.6.4 Elevator Casing, Dribble Valve & Refuse Tubing

Regular inspection of the above parts should be made to detect any wear conditions, physical damage, missing parts or component failure. Repair or replace components as required.

5.1.6.5 Slide Valve Assembly, Control Valve & Feed Hose

© Wheelabrator Group, Inc.

Regular inspection of the above parts should be made to detect any wear conditions, physical damage or component failure. Repair or replace components as required.

5.1.6.6 Bearings

The bearings should be checked for wear. If serious bearing wear is evident the bearings should be replaced. Most bearings are **lubricated for life** and **do not require lubrication**.

5.1.6.7 CFS Separator Assembly

The purpose of the separator is to remove scale, dust and other fine materials from the usable shot (media). This separation is extremely important, since failure to remove these contaminants from the media will not only decrease the productivity (cleaning capability) of the machine, but will also increase the rate of wear on the machine and may cause dust build up on parts.

The satisfactory performance of the machine is dependent on the proper adjustment and maintenance of the separator. It is of utmost importance that the operation be constantly checked. Particular attention should be given to the flow of abrasive as it passes through the separator baffle assembly. The separator assembly should be adjusted so that a uniformly thick falling stream of abrasive material is spread across the full width of the separator. This insures that the abrasive material will be properly exposed to a uniform flow of air through the separator for the air wash separation.

NOTE: A full width uniformly thick curtain must be maintained in the separator at all times for proper cleaning of the media.

© Wheelabrator Group, Inc.

To maintain a uniformly thick full curtain of media across the full width of the separator, the swinging baffle must be properly balanced. This can be accomplished using the counterweight system supplied for the swinging baffle.

Be sure the swinging baffle and adjustable lip are straight and have not been damaged in shipment. The blast gate, at the air outlet vent on the separator, can be adjusted to accurately control the size of the abrasive material that will be removed from the good shot (media).
The components of the separator are subject to very little wear. However, they should be inspected periodically and any damaged components should be repaired or replaced.

Refer to Section 9.3 “Troubleshooting” for separator malfunctions and remedies.

WARNING: If tramp metal or large particles fall into the storage hopper and enter the wheel, the wheel components may shatter and clause severe damage or possible injury.

5.1.7 Ventilation System – Provided by customer or as an option

The ventilation system requires regular inspection of parts and components to insure design performance, and to insure that an adequate flow of air exists and is maintained.

The vent piping from the machine to the dust collector should be checked periodically for wear and leaks. Replace or repair defective parts. The blast gates that adjust machine ventilation should be inspected regularly and replaced as required.

© Wheelabrator Group, Inc.

5.1.8 Electrical

DANGER: Before initiating maintenance procedures, be sure that all power sources are disconnected from the machine and accessories to avoid personal injury from electrical power or from rotating parts. This machine operates on 230, 460 or 575 volts, 3 phase, 60 hertz electrical power.

For the machine to perform efficiently, the electrical equipment must undergo periodic inspection to detect any wear conditions, physical damage, loose connections or component failure. Refer to Section 9 “Troubleshooting” for electrical equipment malfunctions and remedies. Regular maintenance inspections should be performed with particular emphasis on the following:

5.1.8.1 Control Panel

Check out electrical wires and connections for looseness, damage and proper insulation. Tighten, repair or replace.

5.1.8.2 Electric Motors

Periodically inspect the motors for excessive dirt, vibration, or abnormal conditions. Clean, correct, or replace as necessary. Keep the ventilation openings of the motor clear to allow free passage of air.

If excessive friction and overheating of bearings is noted, it is usually caused by the following factors:

1) Bent motor shaft
2) Poor alignment
3) Lubrication – over/under

The bearings of these motors are pre-lubricated with grease by the Manufacturer and should be lubricated after one year of operation. Refer to the Manufacturer’s nameplate for type

© Wheelabrator Group, Inc.

of lubricant. An accurate greasing program should be followed when greasing motors for it has been determined that the greatest cause of bearing failure in motors is over greasing rather than under greasing. Refer to Section 8, Paragraph 8.2 for recommendations on lubricating machine components.

5.2 Lubrication-Oil & Grease

The life and performance of many components of the equipment are dependent on proper lubrication of components. **Most bearings are lube for life** and do not require lubrication. Only electric motors and reducers will require lubrication. Thorough lubrication, performed at regular intervals will aid greatly in prolonging the life of the machine components and in improving efficiency of operation.

Note: The intervals of lubrication are based on normal operating conditions. If severe operating conditions exist, such as extremely dusty conditions or an abnormal amount of stopping and starting, it may be necessary to perform the lubrication more frequently.

While lubrication of the required components is essential, lubrication of some drive components of blast cleaning equipment can be detrimental. For example, chains and sprockets should not be lubricated with petroleum base material because the lubricant tends to accumulate metallic dust in the environment. This causes excessive wear on the chains and sprockets.

The following recommendations should be followed when lubricating machine components:

1) Shut off power to machine during lubrication.

2) Clean dust and contaminants from the points of lubrication.

3) Clean up excessive or spilled lubricants from the equipment.

4) Use clean lubricants.

5) Do not over lubricate. This could result in overheating and possible damage of the components.

© Wheelabrator Group, Inc.

6) The oil in oil-lubricated devices should be changed if the oil shows traces of dirt or shows the effects of high temperature operation, which is evident, by the discoloration of the oil or odor.

7) Drain dirty oil while the unit is still warm, examining for contamination by metal particles.

8) **KEEP IT CLEAN & MAINTAIN CLEANLINESS.**

5.8 Maintenance Do's & Do Not's

DO ensure that the proper shutdown procedures have been executed before performing any internal inspection or maintenance on your machine or associated equipment and that all pressurized elements have been depressurized appropriately, and the machine is electrically isolated.

DO read all manufacturers instructions before performing any maintenance work and follow their recommendations with regard to safety procedures and safe working practices.

DO ensure a good inspection and maintenance program is the best assurance of a productive machine.

DO ensure for safety and performance, always use genuine Wheelabrator Group replacement parts.

DO incorporate preventative maintenance to reduce maintenance and operating costs.

DO keep a log of all inspections and maintenance operations. List all parts replaced, when and who by. Frequent inspection determines what maintenance is required and whether or not a maintenance operation should be performed immediately or may be safely deferred until the next scheduled maintenance period.

DO ensure only experienced personnel should perform the inspection. Inspectors should be thoroughly instructed and experienced in both the function and adjustment of the various components.

DO ensure that suitable protective measures due to the nature of the equipment to be inspected.

DO adequately ventilate while carrying out maintenance work.

DO NOT use the dust collector fan as the ventilation source.

© Wheelabrator Group, Inc.

© Wheelabrator Group, Inc.

Section 6 Troubleshooting

Before attempting any troubleshooting, maintenance personnel and operating personnel should become thoroughly familiar with the equipment.

Follow your Lockout/Tagout procedure (See Safety – Warning & Precautions Section)

Before making any repair or replacement of defective parts, it is very important that the reason for the original failure be determined and corrected. A failure to correct the cause of the problem will inevitably lead to a reoccurrence of the problem, etc.

Blast equipment will often continue to operate and will do an acceptable job even though some of the mechanisms or components are not functioning properly causing a decrease in efficiency. It is important for maximum efficiency, that troubleshooting be performed if either of the following is noted:

1) Increase in abrasive consumption,

2) Decrease in cleaning efficiency.

As an aid to troubleshooting when a deficiency is noted in one of the elements or mechanism of the equipment, the following tables are provided. These tables list the most common troubles, their probable cause and remedies:

6.1 Group No. 04 – Work Door

Trouble	*Probable Cause*	*Possible Remedy*
☹ Limit Switch Fault	😐 Doors physically open.	☺ Close the door.
	😐 Door bracket loose.	☺ Reposition bracket and secure.
	😐 Faulty limit switch.	☺ Remove limit switch, repair or replace.
	😐 No power to limit switch.	☺ Check power connection and check control panel.

© Wheelabrator Group, Inc.

6.2 Group No. 05 – Man Door

Trouble	Probable Cause	Possible Remedy
☹ Limit Switch Fault	😐 Doors physically open.	☺ Close the door.
	😐 Door bracket loose.	☺ Reposition bracket and secure.
	😐 Faulty limit switch.	☺ Remove limit switch, repair or replace.
	😐 No power to limit switch.	☺ Check power connection and check control panel.

6.3 Group No. 09 - Elevator

Trouble	Probable Cause	Possible Remedy
☹ Elevator shutdown	😐 Loose belt or boot jam	☺ Tension the belt or clear the jam. ***Follow safety instructions sign when working on elevator. Reference Safety – Warning & Precaution, Section 2, 2.7.4 Safety Instruction Sign, Part No. 495079***
☹ Elevator Belt Slippage	😐 Loose elevator belt.	☺ Tighten belt by screw take-up arrangement at head section. If belt is stretched so that take-up is ineffective, shorten belt.
	😐 Worn pulleys, travel of belt and rotation of boot pulley are erratic.	☺ Rubber lagging on pulley may be worn. Replace or re-lag pulley.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Jammed Elevator Belt	😐 Foreign objects in elevator boot jam against buckets and casing causing stall.	☺ Inspect and clean boot section periodically. ***Follow safety instructions sign when working on elevator. Reference Safety – Warning & Precaution, Section 2, 2.7.4 Safety Instruction Sign, Part No. 495079***
	😐 Worn buckets - Elevator buckets are worn so that they no longer carry the pre-determined load.	☺ Replace buckets. If belt shows considerable wear, replace complete assembly.
	😐 Excessive abrasive loading	☺ Make abrasive (media) additions slowly. Check abrasive control valve flow rate adjustment. DO NOT overload wheel above rated capacity.
	😐 Belt rubs casing causing motor overload relays to kick out.	☺ Check belt alignment to keep elevator belt centered on pulleys.
	😐 Mechanical bind – motor overload relays kick out.	☺ Check for mechanical binds in motor or gearbox. Check for bad bearings.
	😐 Abrasive control valve leaks abrasive	☺ Lack of air pressure to keep valve closed. ☺ Worn parts. Check and replace worn parts.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Elevator Belt Failure	😐 Belt too tight – breakage may occur at splice	☺ Belt should be adjusted to proper tension. When belt is under proper tension, splice is not overstressed.
	😐 Foreign objects in boot cause sudden jamming, belt stretches and breaks.	☺ Sudden jams should be avoided. Keep boot section clean; remove foreign objects. ***Follow safety instructions sign when working on elevator. Reference Safety – Warning & Precaution, Section 2, 2.7.4 Safety Instruction Sign, Part No. 495079***
	😐 Badly worn belt may suddenly break.	☺ Inspect belt and splice. Replace when necessary.
☹ Belt does not run at center of head pulley.	😐 Improper adjustment of head pulley.	☺ Realign pulley by means of the adjusting screws on elevator head section.
	😐 Improper splicing results in crooked belt, which rides from side to side on head pulley.	☺ Be sure that splice and belt are squarely assembled.
	😐 Worn crown on head pulley causes belt to ride on one side or the other.	☺ Check head pulley. These are crown face pulleys. If crown is worn, replace pulley.
	😐 Belt cannot be aligned properly although all components seem to be in proper condition.	☺ Check overall alignment of head and boot pulley by dropping plumb line from top to bottom –

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		realign if necessary.
☹ Zero Speed Fault	😐 No power to the gearmotor.	☺ Check power connection and check control panel.
	😐 Frozen gearmotor.	☺ Remove gearmotor, repair or replace.
	😐 Frozen bearing.	☺ Remove bearing, repair or replace.
	😐 Slack belt or boot jam.	☺ Tension the belt or check to see if there are any foreign bodies, if so remove. ***Follow safety instructions sign when working on elevator. Reference Safety – Warning & Precaution, Section 2, 2.7.4 Safety Instruction Sign, Part No. 495079***
☹ Noisy Gear Motor.	😐 Lack of oil.	☺ Check oil levels, add oil if necessary.
	😐 Bad gears.	☺ Remove gearmotor, repair or replace.
☹ Noisy Bearing	😐 Lack of lubricant.	☺ Check if seals are dry, add lubricant as necessary.
	😐 Bad bearing	☺ Remove bearing, repair or replace.

© Wheelabrator Group, Inc.

6.4 Group No. 10 & 14 – Separator & Upper Screw

To determine if the separator is functioning properly, make a visual analysis of the abrasive after separation and of the material from the separator refuse discharge spout.

Trouble	*Probable Cause*	*Possible Remedy*
☹ Removing good abrasive	😐 Too much air on separator	☺ Adjust blast gate setting.
	😐 Full curtain is not maintained across separator.	☺ Check stationary baffle and swinging baffle operation. Adjust baffles as needed to obtain a full curtain.
☹ Reduced air flow	😐 Air leaks in metal case or vent piping connections.	☺ Repair or replace as necessary.
	😐 Air leak from discharge tubing.	☺ Verify the dribble valve on the fines discharge tube is sealing and in good operating condition.
☹ Contaminated Abrasive.	😐 Insufficient flow of air delivered by ventilation.	☺ Adjust blast gate setting. ☺ Check line for blockage. ☺ Check fan output.
	😐 Full curtain is not maintained across separator.	☺ Check stationary baffle and swinging baffle operation. Adjust baffles as needed to obtain a full curtain.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
	Fines hopper and tube are plugged.	Clean out tube and fines hopper.
	Magnets on drum not properly positioned. (This is only on magnetic separator designs.)	Confirm proper position and secure mounting of magnet assembly using external scribe mark reference guides on shaft end and locking collar.
	Burden Plate not in proper position. (This is only on magnetic separator designs.)	Verify position of burden plate to insure effective retention of abrasive and sand mixture against rotating drum.
Good abrasive in separator fines discharge.	Too much air through separator.	Adjust slide gate. Check fan output.
	Hopper overfilled.	Control additions.
	Hole worn in separator chute.	Patch hole.
	Magnets on drum not properly positioned. (This is only on magnetic separator designs.)	Confirm proper position and secure mounting of magnet assembly using external scribe mark reference guides on shaft end and locking collar.
	Burden Plate not in proper position. (This is only on magnetic separator designs.)	Verify position of burden plate to insure effective retention of abrasive and sand mixture against rotating drum.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Zero Speed Fault	😐 No power to the gearmotor.	☺ Check power connection and check control panel.
	😐 Frozen gearmotor.	☺ Remove gearmotor, repair or replace.
	😐 Frozen bearing.	☺ Remove bearing, repair or replace.
	😐 Slack belt or boot jam.	☺ Tension the belt or check to see if there are any foreign bodies, if so remove. ***Follow safety instructions sign when working on Upper Screw. Reference Safety – Warning & Precaution, Section 2.***
☹ Noisy Gear Motor.	😐 Lack of oil.	☺ Check oil levels, add oil if necessary.
	😐 Bad gears.	☺ Remove gearmotor, repair or replace.
☹ Noisy Bearing	😐 Lack of lubricant.	☺ Check if seals are dry, add lubricant as necessary.
	😐 Bad bearing	☺ Remove bearing, repair or replace.

© Wheelabrator Group, Inc.

6.5 Group No. 16 – Manual Blast Tank

Trouble	Probable Cause	Possible Remedy
☹ Air Blast but No Abrasives	😐 The pot is empty.	☺ Fill the pot
	😐 The abrasive in the pot is wet.	☺ Close the choke valve until some abrasive is pumped out. Operating the unit in the "choked" condition will allow the use of media that is too damp to flow properly, but it greatly accelerates wear in the metering valve. Continuous running in the "choked" position also reduces productivity and therefore should be avoided if possible.
	😐 Foreign matter is plugging the abrasive metering valve.	☺ Close the choke valve and opening the abrasive metering valve momentarily to see if that will blow the obstruction out. If that does not work then it will be necessary to depressurize the pot and remove the obstruction by hand.
☹ Reduced Pressure at the Nozzle (with or without abrasive flow)	😐 Insufficient air compressor (see air requirements chart).	☺ Air hose is too small. ☺ Abrasive adjustment is open too far. ☺ Pop-up not seating properly. ☺ Obstruction in line of blast hose.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Unit is Slow to Turn or Will Not Turn On	Air hose is too small. The air hose diameter should be at least three (3) times the nozzle diameter. (Air blows out the blow down but the pot does not pressurize.)	☺ Insufficient air compressor. (Air blows out the blow down but the pot does not pressurize.). ☺ Check quick disconnects couplings on control hoses to be sure they are engaged properly. ☺ Control hoses are leaking. (The pot turns on slowly or does not turn on at all.) Control hoses are plugged. (If the black hose is disconnected from the cylinder of the combo valve, there should be air pressure whenever the dead man is depressed.) ☺ Worn piston seal in the combo valve. (Air blows out the brass breather vent on the combo valve.)
☹ Unit is Slow to Turn or Will Not Turn On	😐 Air hose is too small. The air hose diameter should be at least three (3) times the nozzle diameter. (Air blows out the blow down but the pot does not pressurize.)	☺ Deadman is plugged. (Only a weak air signal, or none at all, comes from the deadman when the black control hose is disconnected. ☺ Defective cartridge in the deadman. (Air blows out the deadman whenever the lever is depressed.)

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		☺ On normally closed systems only: Defective diaphragm in automatic air valve. ☺ On normally closed systems only: Defective diaphragm in blow down valve
☹ Unit is Slow to Turn Off or Will Not Turn Off	😐 Twin line hoses crossed. The left part of the deadman should be connected to the combo valve using the black hose.	☺ The lower rod guide seal is defective. (If you disconnect the black hose from the 1/8" port on the combo valve, air should not blow out of the combo valve). ☺ The lower pod guide "O" ring is damaged or missing. ☺ The lower pod guide is installed upside down (the pot turns on as soon as the compressed air is turned on). ☺ The valve plug in the combo valve is defective and will not seal. ☺ Bleeder type deadman has been installed.
	😐 Unit Turns On Accidentally	☺ The lever on the deadman is worn out. Replace the lever . ☺ The safety button on the deadman is missing.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		☺ Bleeder type deadman has been installed. A bleeder type deadman is unsafe because a piece of dirt from the air hose can plug the hole in the deadman and cause the blast unit to turn on.

6.6 Group No. 17 – Paint Ventilation

Trouble	Probable Cause	Possible Remedy
☹ Visible Stack Emissions.	😐 Improperly Installed Filters.	☺ No gaps around the filters. ☺ The filters are not damaged.
☹ High Differential Pressure.	😐 Over Volume.	☺ Check fan and motor speeds and V-belt drive ratio.
	😐 Plugged Magnehelic Line.	☺ Check and clean out if lines are plugged.
	😐 Filter Blinding.	☺ Check system so that oil or free moisture is not entering the filters either from the process or the compressed air system.
☹ Inadequate System Volume	😐 Fan Rotating Backwards.	☺ Check rotation of fan and correct if necessary.
	😐 Fan RPM & Volume Too Low.	☺ Check drive ratio between fan and motor. Check drive for slippage - re-tighten or replace as required.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Noisy Gear Motor.	😐 Lack of oil.	☺ Check oil levels, add oil if necessary.
	😐 Bad gears.	☺ Remove gearmotor, repair or replace.
☹ Noisy Bearing	😐 Lack of lubricant.	☺ Check if seals are dry, add lubricant as necessary.
	😐 Bad bearing	☺ Remove bearing, repair or replace.

6.7 Group No. 19 - Ducting (Ventilation System)

Proper maintenance of the ventilation system is just as important as the servicing of other elements of the blast equipment.

The following troubleshooting chart is provided as an aid for maintaining adequate and efficient ventilation.

Trouble	Probable Cause	Possible Remedy
☹ Abrasive carryout to dust collector.	😐 Too much air.	☺ Close cabinet vent blast gate slightly.
☹ Fines and contaminants not properly removed from abrasive.	😐 Too little air or improper separator adjustments.	☺ Open separator blast gate slightly. ☺ Check for build-up of particles in ductwork, clean out as needed. ☺ Check dust collector discharge container – every shift. Empty before container is full.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		☺ Overloaded ventilation system cannot function properly. Check for holes in flexible hose and any obstructions. Repair/remove. System should be as free as possible from air leakage.
☹ Loss of abrasive – carryout of good abrasive from machine.	😐 The dust collector is delivering too great a flow of air.	☺ Close the dust collector blast gate slightly for proper ventilation.
☹ Contaminated abrasive – fines and contaminants not properly removed from abrasive.	😐 Insufficient flow of air through separator to collector.	☺ Check exhausts fan rotation. ☺ Open blower exhaust damper if present. ☺ Check Magnehelic reading. ☺ Check pulse or shaker operation of collector and increase, if necessary. ☺ Replace filters, if necessary.

© Wheelabrator Group, Inc.

6.8 Group No. 20 Blast Wheel Assembly

Trouble	Probable Cause	Possible Remedy
☹ Excessive vibration – usually indicates that the Wheel Assembly is out of balance. This condition will eventually cause motor or unit bearing failures.	😐 Unevenly worn wheel, blades, hub, and/or impeller.	☺ Replace worn parts and check separator operation for removal of contaminants.
	😐 Broken or chipped blades.	☺ This condition will throw the wheel permanently out of balance and cause damage to other parts of the unit. Replace broken blades immediately using full set of new blades. Retrieve all broken parts before operating the equipment.
	😐 Improperly mounted wheel.	☺ Wheel must be squarely mounted and evenly tightened onto hub or motor shaft – check wheel for wobble.
☹ Drop in blast wheel amperage.	😐 Not enough abrasive getting to the blast wheel.	☺ Check the level of abrasive in the storage hopper. If the level is low, add abrasive to the system. If the abrasive level seems adequate, check the abrasive valve & blast wheel feed spout for blockage.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Excessive noise – besides being undesirable, it may also indicate misalignment of wheel components that cause failures or wear.	😐 Improper clearances between wheel and feed spout, wheel and wheel compartment liner or control cage and impeller.	☺ Check alignment and clearance of components in relation to each other. Allow equal clearances between moving parts to avoid pinch points and prevent contact against one another.
	😐 Loose bolts or misalignment	☺ Make certain that all components are firmly secured.
	😐 Defective bearings	☺ Check the rotation of the unit bearing or the drive motor. Both should rotate freely and smoothly. Repair or replace bad bearings or motors.
☹ Increased Cleaning Time	😐 Improper abrasive feed to wheel.	☺ If an ammeter check indicates a lower ampere reading than the normal full load rating, check: **a)** Quantity of abrasive and add if level is low. **b)** Abrasive control valve adjustment for proper abrasive flow rate.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		c) Abrasive may contain a large percentage of fines and other contaminants, which should have been removed by the separator – check ventilation system, swinging baffle operation, and abrasive screen analysis. **d)** Feed line obstructions may cause reduced flow to the wheel, check and clean out.
	😐 Loss of Directional Control of Blast Pattern. Abrasive will strike sections of the wheel housing, or cabinet components other than work to be blasted. This increases cleaning time, wear and maintenance.	☺ Conduct a blast pattern test. Make certain that you have definitely located the usable blast pattern. Adjust control cage accordingly so that the blast pattern is directed onto the work most effectively.
☹ Blast wheel shutdown	😐 Abrasive valve worn causing overload.	☺ Replace the worn abrasive valve parts.
☹ Abrasive Leakage	😐 Improper sealing.	☺ Check wheel housing and motor shaft seal.

© Wheelabrator Group, Inc.

6.9 roup No. 30 - Dust Collector

Trouble	Probable Cause	Possible Remedy
☹ Visible Stack Emissions	😐 Improperly Installed Filters	☺ Check to ensure that the locking cams are fully locked. ☺ Check to ensure that venturi lip is located within the gasket. ☺ Check and make sure all gaskets are properly seated and compressed against the tube sheet. ☺ Check and make sure for respective number of filters installed inside the housing.
	😐 Dirty/Clean Air Plenum.	☺ Always clean the tube sheet when dust accumulation is present. ☺ After filter failure or sometimes during routine filter change-outs, dust can accumulate in dead air zones on the clean air side of the unit.
	😐 Torn or Punctured Filters	☺ Inspect filters for tears or punctures caused by mechanical damage, abrasion, thermal or chemical attack. Replace filters as and where required.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ High Differential Pressure	😐 Over Volume	☺ Check fan and motor speeds and V-belt drive ratio. ☺ Reset fan speed to handle collector design volume.
	😐 System Resistance Static is too low	☺ Re-calculate ductwork design to ensure proper static losses. If too low reduce fan speed or add system resistance with balancing dampers.
	😐 Plugged Magnehelic Line	☺ Check and clean out if lines are plugged.
	😐 Lack of Compressed Air	☺ Check pulsing system for compressed air leakage and seal as required. ☺ Check compressor output to ensure it exceeds pulse cleaning system usage, Add extra volume as required. ☺ Compressed air pressure too low - increase line pressure from regulator - compressor. (Not to exceed 90 P.S.I.) ☺ Check clogged feed lines for oil, water, rust or debris.
	😐 Malfunctioning Timer	☺ Check timer outputs to ensure all terminals are firing. If timer is faulty, return to Wheelabrator for repair.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		☺ On some system, all the channels may not be used. A faulty channel may be bypassed and a spare channel used in this case.
	😐 Dust Re-Entrainment	☺ Check dust removal system for worn or faulty seals. Repair or replace as required. ☺ Check mating flanges - apply gasketing and/or tighten fasteners as required. ☺ Dust disposal system plugged or jammed - clean and check disposal system for capacity. Speed up system, install vibrators or enlarge hopper opening as required. ☺ Check baffle for abrasion and wear.
	😐 Dust on Clean Air Side	☺ Check tube-sheet floor and clean as necessary to prevent dust from entering cartridges from clean air side. ☺ Check inside of filters for dust and empty as required. Dust in filters will cause stack emissions on a cycle synchronized with pulse blasts.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
	😐 Filter Blinding	☺ Check system so that oil or free moisture is not entering the filters either from the process or the compressed air system. ☺ Check fan to ensure collector was started under ***throttled*** conditions. Extra high speed impingements of fine particles on new media can permanently blind filter media.
☹ Inadequate System Volume	😐 Fan Rotating Backwards	☺ Check rotation of fan and correct if necessary.
	😐 High Differential Pressure	☺ Refer to the section above.
	😐 Fan RPM & Volume Too Low	☺ Check drive ratio between fan and motor. Check drive for slippage - re-tighten or replace as required.
	😐 Leakage in System	☺ Check all ducting and flanges to and from collector for leaks. Re-gasket and tighten fasteners as required.
	😐 System Resistance Static Too High	☺ Re-calculate ductwork design to ensure proper static losses. If too high, increase fan speed or lower system resistance by changing ductwork and/or hoods.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		☺ Check ductwork for material build-up or blockages. Clean and re-design if necessary.
	😐 Blinded Filters	☺ Inspect filter elements for possible blinding. ☺ Blinded filters usually result in high differential pressure. Clean with fan off until differential pressure drops off. If differential pressure is still high, install new cartridges.
	😐 Fugitive Air Entrainment	☺ Check all doors and cover plates for proper sealing. ☺ Check all ductwork flanges for airtight seals. Apply gaskets and retighten fasteners.
☹ Low Compressed Air Pressure At the Header	😐 Sticking Solenoid Valves	☺ Check solenoid plungers for dirt. Clean or replace as required. ☺ Short circuit in wiring may cause one or more solenoids to remain open - check wiring and repair or replace as required.
	😐 Pulse Time is Too Long	☺ The “Pulse Time” is factory preset and sealed at 100 m/s elect time maximum. If this has been tampered with, set back to original setting

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
		of 100 m/s.
	😐 Sticking Diaphragm Valves	☺ Check for torn or damaged diaphragms.
	😐 Debris in Diaphragm Valves	☺ Check for dirt, desiccant, oil or ice on diaphragm. Clean or replace as required. If oil, water or ice is present, repair or install dryer on compressed air system to eliminate.
	😐 Leaks in Compressed Air Piping	☺ Inspect compressed air lines for leaks and seal failure.
	😐 Insufficient Supply of Compressed Air	☺ Check capacity of air compressor to ensure proper sizing. See Detail of Order to determine demand of unit. Also check for undersized branch lines in compressed air run.
	😐 Header/Air Valve Connection is Faulty	☺ Inspect connection and repair as required.
	😐 Check Physical and Chemical Characteristics of process Against Filter Media Rating.	☺ Adjust system gas stream or install new media compatible with gas stream.
☹ Filter Element Problems (Poor Life, Blinding, etc.)	😐 Check System Operating Temperature against Filter Media Rating.	☺ Lower temperature of system or refurbish with media suitable to higher temperatures encountered.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Check Abrasion Patterns on Collector Walls, Baffles, Etc.	😐 Check Material Build-up in Hopper	☺ Inspect dust disposal equipment for proper operation. Repair as required. ☺ Check for hopper bridging. ☺ Install vibrators, poke hole, etc. or enlarge discharge opening.
	😐 Incorrectly Installed Filter Elements	☺ Check for proper seating of filters to tube sheet.
	😐 Dirty/Clean Air Plenum	☺ Inspect tube sheet floor for dust accumulations. Dust on tube sheet can reenter into the inside surface and blinding the filters by reverse pulse-jet cleaning action.

© Wheelabrator Group, Inc.

6.10 Group No. 96 - Electrical Equipment

NOTE: DISCONNECT ALL ELECTRICAL POWER SOURCES BEFORE ATTEMPTING MAINTENANCE OR REPAIR.

6.10.1 Motors

Trouble	Probable Cause	Possible Remedy
☹ Wheel Motor	😐 Overheats and overloads trip out.	☺ Check for mechanical binds.
☹ Elevator Motor	😐 Overheats or motor stops.	☺ Check tightness of elevator belt and if centered on top pulley.
☹ Electric Motors do not Start	😐 Main power cable disconnected at electrical source.	☺ Check main power cable at electrical source. Must be 230, 460 or 575 volt, 60 hertz, 3 phase
	😐 Blown Fuses	☺ Check fuses. Replace if defective.
	😐 Applicable motor starter overload relay trips out.	☺ Reset starter.
☹ Electric Motors do not Come Up to Speed, Run Slow	😐 All phases of 230, 380, 460 or 575-volt supply not connected properly.	☺ Recheck wiring for loose or improper connections.
	😐 One fuse blown in disconnect box.	☺ Check all fuses. Replace as required.

© Wheelabrator Group, Inc.

6.10.2 Starters and Control Panel

Trouble	Probable Cause	Possible Remedy
☹ Overload Relay	😐 Overloads trip out.	☺ Do not increase the overload setting; check load with ammeter; compare with overload relay setting. If load is excessive, determine cause and correct.
☹ Contacts and Contact Springs	😐 Contacts badly pitted.	☺ Replace
☹ Fuse Protection	😐 Fuses blow.	☺ For the occasional "blow", fuses may be loose in fuse holders, or temporarily overloaded. If persistent, check for grounded circuit, bare wire.
☹ Overload Relays Trip continuously	😐 Overload in circuit low power.	☺ Shut down particular circuit. Check power source for proper voltage.
	😐 Broken, damaged or loose wiring.	☺ Inspect wiring for broken, cut wires and loose terminals. Replace/repair as required.
	😐 Dirt or contaminants at terminals.	☺ Clean contacts and terminals.

© Wheelabrator Group, Inc.

Trouble	Probable Cause	Possible Remedy
☹ Wheel Motor Sound Not Continuous	😐 Abrasive level low.	☺ Add abrasive to specified level.
	😐 Loose connectors.	☺ Tighten electrical connectors.
	😐 Abrasive system clogged or damaged.	☺ Clean or replace defective parts.

6.10.3 Control Accessories – Operator's Control Panel

Trouble	Probable Cause	Possible Remedy
☹ Pushbuttons	😐 Buttons stick.	☺ Probable cause – abrasive dust. Remove cover and clean.
	😐 Erratic Operation	☺ Check contacts for dirt, springs broken or out of place.
☹ Ammeter	😐 Dirty	☺ Carefully clean ammeter with a fine brush.
	😐 Inaccurate reading	☺ Bent indicator pointer. Replace meter.
	😐 Failure	☺ Replace meter.

Section 7 Parts & Service Group

7.1 The Wheelabrator Plus Program

The Wheelabrator Group is the preeminent provider of blasting equipment, parts, and services in the industry. The manufacturing and technology leader in the field of wheel blasting for nearly 100 years, the Wheelabrator Group continues to stand by its customers through the latest in surface preparation parts, services and techniques. Our Wheelabrator Plus family of products and services are designed for the industrial professional who is looking to optimize the potential of his/her current blasting process. The scope of supply is not exclusive to the Wheelabrator Group, as the technical expertise is process focused and has been successfully applied to all equipment types. No matter the opportunity or brand, Wheelabrator Plus is available to answer your most significant process questions and opportunities.

7.2 Equipment Modernization Programs (EMP)

Wheelabrator makes the latest technology and process improvements available for all wheelblast equipment. Prior to any equipment modernization recommendations, Wheelabrator professionals will provide inspection services for your current blasting equipment to determine the optimal solution for your requirements. Part of the assessment includes reviewing the available modernization options with the customer to determine what cost savings or efficiencies will be realized as a result of the modernization process.

© Wheelabrator Group, Inc.

7.3 Replacement Parts

The Wheelabrator Group offers a wide variety of blast technologies, and has the most extensive knowledge of the industry. Wheelabrator Plus offers replacement parts for a wide variety of equipment. If you are looking to replace a part from a Wheelabrator machine, or looking for a competitive part, Wheelabrator will assist you in determining the specific part for your equipment.

7.4 Service, Maintenance and Training

At Wheelabrator Plus, our goal is to assist you in ensuring that your blast equipment performs to your expectations. Wheelabrator will define a service and maintenance schedule that fits in with your requirements, as well as providing training to your staff to ensure that the equipment continues to work in the most productive manner.

Section 8 Operations & Maintenance Manual Addendums

8.1 See Media Delivery System Addendum

(Individual supplements, provided based on type of media delivery system)

- **Wheel Media Delivery System:**
  - 25 EZEFIT® Wheel
  - Autoblast® Wheel
  - BD Wheel
  - EZEFIT® Wheel
  - Micro Wheel
  - SH35 Wheel
  - Etc.

- **Air Blast Media Delivery System:**
  - Air Blast Equipment Manual
  - Air Blast Equipment Automated

8.2 See Operations of Equipment Addendum

- **Operations – Wheel Blast**
  - Functions of Control Panel Instruments
  - Sequence of Operation
  - Start-Up & Checkout Procedure

- **Operations – Air Blast**
  - Functions of Control Panel Instruments
  - Sequence of Operation
  - Start-Up & Checkout Procedure

© Wheelabrator Group, Inc.

8.3 See Commercial Parts Addendum

- Commercial Parts consisting the following:
  - Commercial Part Supplements (Links and/or physical copies)

8.4 See Recommended Spare Parts List Addendum

- Recommended Spare Parts consisting the following:
  - High Wear Parts, Common Consumables, etc.

8.5 See Equipment Drawings Addendum

- Equipment Drawings consisting the following:
  - General Arrangement, Major Assembly, Schematics, etc.

8.6 See Exhaust Piping Construction Addendum

- General Exhaust Piping Construction

8.7 See Dust Collector Addendum (If Purchased)

- Dust Collector consisting the following:
  - Safety Instructions
  - How the Dust Collector Works
  - Inspection Schedule & Checklist
  - Troubleshooting

WARRANTY 3783

Serial # 3783 – GNA Alutech
9495 Transcanada Highway, St-Laurent Qc
Purchase Order: 00006492

WARRANTY

Seller warrants that the equipment described herein will be free from defects in material and workmanship for a period of twelve (12) months from shipment ("Warranty Period"). If within the Warranty Period Seller receives written notice promptly after the discovery of any defect in the material or workmanship Seller shall correct each such defect FOB point of manufacture. Seller shall undertake its warranty obligation of repair, replacement within a reasonable time of receiving actual notice of the warranty defect. Seller shall be fully compensated for expenses of travel and for job time (at Seller's then prevailing per diem rates for straight time and premium time, as applicable) of its service representatives who inspect warranty claims that are not warranty issues. Buyer shall issue a purchase order for these expenses prior to Seller's representatives arrival on site Purchaser has no right to and may not backcharge Seller for warranty claims without prior approval. Normal wear parts and labor are not included. The liability of Seller to Purchaser/Buyer arising out of or the supplying of the equipment whether under warranty, tort, contract, negligence, strict liability or otherwise, shall not in any case exceed the cost of correcting defects in Equipment and upon the expiration of said warranty, all such liability shall terminate. This warranty is conditioned upon the Equipment being handled, operated, and maintained in accordance with written instructions provided or approved in writing by Seller. This Warranty is not applicable to commercial items used on Seller's assembled equipment; such issues shall be covered by any terms provided by the
original equipment manufacturer for any respective commercial item. Seller makes no warranties which extend to damage to the Equipment due to deterioration or wear occasioned by chemicals, abrasion, corrosion or erosion, improper erection, operation or maintenance, abnormal conditions of temperature or dirt, or operation of the Equipment, and Purchaser's exclusive remedy shall be limited as above provided. THE WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABLITY OR FITNESS FOR PARTICULAR PURPOSE. The remedies set forth herein are expressly declared to be the sole and exclusive remedies hereunder. There shall be no liability to anyone for special, incidental or consequential damages with respect to the Equipment or for any related economic loss or property damage.

Certificate No. 13991

ASTA CERTIFICATION SERVICES

(Incorporated in the year 1938) ASTA House, Chestnut Field, Rugby, CV21 2TL, England

Laboratory Ref. No. QZA

CERTIFICATE OF SHORT-CIRCUIT RATING.

APPARATUS:	The three phase and neutral main horizontal and vertical riser busbars of a five cubicle incomer, feeder and bussection assembly, suitable for TNS systems. U_e = 440V U_i = 1000V.
DESIGNATION:	Main Switchboard with AT air circuit breakers.
MANUFACTURER:	New Circut Engineering, 117 Ruchill Street, Glasgow.
TESTED BY:	Fluvent Technical Services, Mosley Road, Trafford Park, Manchester.
DATE(S) OF TESTS:	8th & 9th December, 1998.

The apparatus, constructed in accordance with the description, drawings and photographs incorporated in this certificate has been subjected to the series of proving tests in accordance with IEC 439-1:1992 including AMD1 11/95 and AMD2 11/96, BSEN 60439-1: 1994 incorporating amendments 1, 2 & 3 clause 8.2.3 sub clauses 8.2.3.2.3 (b) and (d).

The results are shown in the Record of Proving Tests and the oscillograms attached hereto. The values obtained and the general performance are considered to comply with the above Standard(s) and to justify the ratings assigned by the manufacturer as stated below.

Short-time peak and withstand current tests on copper busbars.
2 x 160 x 10mm, 1 x 160 x 10mm main horizontal and bussection busbars.
1 x 100 x 10mm bussection to AT25 ACB 1 x 160 x 10mm vertical riser busbars to the AT25 ACB.
65kArms for 1 second 143kApk (n=2.2) three phase and single phase.
2 x 160 x 10mm and 2 x 120 x 10mm vertical riser busbars to the AT40 and AT32 ACB's respectively.
80kArms for 1 second 176kApk (n=2.2) three phase and single phase.
1 x 120 x 10mm vertical riser busbars to the AT20 ACB.
50kArms for 3 seconds 105kapk (n=2.1) three phase.
30kArms for 3 seconds 63kApk (n=2.1) single phase.
1 x 80 x 10mm vertical riser busbars to the AT12 ACB.
50kArms for 1 second 105kApk (n=2.1) three phase.
30kArms for 1 second 63kApk (n=2.1) single phase.

The record of Proving Tests apply only to the apparatus tested. The responsibility for conformity of any apparatus having the same designations with that tested rests with the Manufacturer.

This Certificate comprises 21 pages, 3 diagrams, 28 oscillograms, 9 photographs, 11 drawings and no other sheets as detailed on page 1.

integral reproduction of this Certificate, or reproductions of this page accompanied by any page(s) on which are the assigned rated characteristics of the apparatus tested, are permitted without written permission from ASTA, House, Chestnut Field, Rugby CV21 2TL England (see overleaf)

NATIONAL ACCREDITATION OF CERTIFICATION BODIES

Registration Number 010

The use of the Accreditation Mark indicates accreditation in respect of those activities covered by the accreditation certificate number 010.

29th July 1999 Date

Declaration of Conformity

We, NCE Switchgear of 79 Beardmore Way, Dalmuir, Glasgow, G81 4HT, Scotland, declare the Low Voltage and Controlgear assembly described by documents:

Arrangement Drawing: ***D6608-1 General Arrangement***

Electrical Diagrams: ***D6608-2, D6608-3, D6608-4, D6608-5A, D6608-5B AS WELL AS CLIENT DRAWINGS***

to which this declaration relates, is in conformity with:

BSEN 60439/1 1999 - *Low voltage switchgear and Control gear assemblies. Part 1 Specification for type-tested and partially type-tested assemblies.*

The components have been assembled under the instructions and methods stated by the suppliers, the assembly is deemed to comply with the following provisions of the Council of European Communities Directives.

* 89 336/EEC EMC Directive

* 73 23/EEC Low Voltage Directive

If the assembly is incorporated into machinery to which Council directive 89/392/EEC applies, it must not be put into service until the machinery has been declared in conformity with that directive.

Maintenance of Electrical Control Gear

1 Introduction

The maintenance of electrical control gear means keeping the gear in good working condition, but those concerned with this work should also familiarise themselves with the plant driven by the electrical control gear and report any changes which affect the system. Many of the failures in electrical control gear are caused by incorrect allocation of particular components and can only be cured by replacement with a suitable model.

Recommended procedures for testing, inspection and maintenance of the principle components of electrical control gear are detailed below.

Note: Some of the more complicated components used in the system require specialised maintenance, and we do not attempt to cover these in this section. Refer to the component literature section for further information.

2 General

The essence of good maintenance is applied common sense. Good maintenance is an important part of good housekeeping in a plant. If the staff responsible give due regard to the safety of personnel, safety of plant and continuity of operation then, generally speaking, costs will take care of themselves and there will be few troubles with the maintenance of electrical control gear.

3 Analysis of Faults

Every fault should be recorded, analysed, and consideration should be given to the cause of the breakdown. Wherever possible the appropriate remedial action should be taken to avoid the reoccurrence of the fault.

4 Change in Service Conditions

The maintenance staff should always be on the look out for, and should report immediately, any changes in service conditions which may have a detrimental effect on the control gear. Such changes may either necessitate more frequent maintenance or the replacement of the electrical control gear. These changes may occur in:

- load conditions
- safety conditions
- site conditions

5 End of Useful Life of Components

There comes a time with electrical control gear when various components such as contactor contacts become worn and require large scale replacement. It is often difficult to decide when this moment has arrived, but when routine maintenance becomes costly the position should be reviewed and the equipment completely overhauled or replaced. Improvement in design over a long period may alone make a change worthwhile.

6 Isolation Before Maintenance Work

Before any work is carried out on or near parts which are normally live, or where danger would arise to personnel working if the equipment was inadvertently started, it is essential that the equipment be isolated and proved dead. In the case of equipment operating above 650 volts the conductors should also be efficiently earthed.

7 Cleanliness

For equipment to operate satisfactorily it is essential that it be kept clean. Before removing covers and opening doors, loose dirt and dust resting on the top of the enclosure should be removed using a brush.

7.1 When air is used for cleaning, a suction type device with dust collection should preferably be used. It is not recommended to use blown compressed air.

7.2 'Cotton waste' should not be used for cleaning. If cloths are used they should be chemically cleaned and free from loose fibres. This is particularly important with oil immersed equipment as the loose fibres may aline under dielectric stress and lead to failure of the equipment.

7.3 When solvents are used for cleaning or degreasing they should be of a non-flammable and non toxic nature, and at all times precautions against fire should be observed.

After maintenance work all covers and doors including those of instruments and relays should be securely replaced to prevent the ingress of dust.

8 Marking of Covers and Connections

All covers, cables, shields etc should be marked carefully before removal to ensure correct replacement.

If connections are disturbed or temporary connections made for testing purposes, they should be clearly marked to facilitate reconnection. The permanent connection must be restored and the temporary connections removed before the unit is returned to service.

9 Tightness of Connections

After maintenance, the bolts, screws and locking devices of all current carrying and earth connections should be securely replaced.

Connections which have not been disturbed should be checked for soundness. It is not sufficient for nuts and bolts to appear tight, sometimes a bolt will not be threaded quite far enough and will give the impression of a tight connection when in fact, the connection is loose. A millivolt drop test will reveal bad connections and it may be possible to detect a bad connection by looking for signs of overheating.

Connecting aluminium to aluminium, copper or brass satisfactorily requires care, particularly if the joint is to be made and broken from time to time, and the use of proprietary compounds may be advantageous.

10 Maintenance of Insulation

Reliable insulation is as important as conductors and with this in mind close visual inspection and regular testing are most essential.

10.1 Testing

Visual examinations usually suffice for moulded insulators but other insulation such as synthetic resin bonded paper (S R B P) are particularly susceptible to the ingress of moisture, overheating or tracking and visual inspection should be supplemented by regular testing.

Insulation resistance measurements are easily made and the most suitable for routine tests, but for their proper interpretation, systematic testing and recording methods are essential. It is only possible to judge the condition of insulation by comparing insulation resistance readings taken over a considerable period. If these show a steady decline in value, the danger is greater than if a steady low value is recorded. If humidity and/or temperature readings are taken at the same time as the insulation tests this may prove advantageous. Where possible insulation should be allowed to reach ambient temperature before tests are carried out.

Thorough visual examination for cracks or other mechanical damage is as important as electrical tests.

10.2 Cleaning

It is advisable when cleaning insulation to wipe across the likely tracking path and not in line with it. The use of a brush in conjunction with caution is recommended and note should also be taken of the recommendations set out in paragraph 7.

11 Isolators and Fuse Switches

Because one side of most isolating devices carries the incoming supply and other control voltages on the auxiliary contacts, special care must be taken to ensure it is fully isolated before any maintenance is carried out.

The correct operation of isolators and fuse switches plays a major part in safety of personnel, most modern day types do not have removable contacts etc and as such require little more maintenance than a visual inspection, cleaning is necessary, and checking of tightness of connections. However as they normally control access to starter compartments proving the operation of any door interlocking must be carried out.

12 Fuses

Where cartridge type fuses are used, replacements should be of the same type and rating as the original. In no circumstance should attempts be made to rewire non rewirable type

fuses. Where a locking device is employed to hold the fuse in position it should be replaced when the work is finished.

If any one or more fuses in sets (eg three phase circuit) has blown it is recommended that all three are replaced and the old ones destroyed.

If any fuse has blown the reason for this must be traced and rectified before replacing the fuse.

13 Fuse Holders

The only maintenance required for fuse holders is a visual inspection, checking for tightness of connections and lightly smearing knife contacts with petroleum jelly.

14 Pushbuttons/Selector Switches etc

Local and remote 'stop' buttons are an important part of electrical installations. Failure to ensure proper maintenance of either operational or emergency stop pushbuttons can therefore constitute a major safety hazard. Maintenance work on control equipment must always include a careful visual and operational check on all pushbutton/selector switched etc. The fact that emergency stop pushbuttons may seldom be used makes it more important to regularly inspect them.

All pushbuttons that have a spring return operation should also be checked for any jamming.

15 Air Break Contactors and Block Relays

Most air break contactors of modern design are of the block type, at the lower ratings of contactors and block relays maintenance consists of a visual inspection and checking tightness of connections. Normally the only spare parts available are operating coils which can be replaced according to manufacturers instructions. With larger rating contactors the above still applies but replacement contacts are also normally available. After any maintenance work has been carried out the contactors operation should be proved with the main supply isolated.

If a mechanical latching attachment is used operation of this should also be included in regular maintenance.

If a contactor hums during operation it is likely that swarf or some other foreign material has got onto the magnet armature face, if this is the case the contactor should be disassembled and the magnet armature face cleaned, failure to do this could lead to an overheated operating coil. Under no circumstance should any attempt be made to clean the surface of contacts and also no lubricating material such as oil be used unless specifically stated elsewhere in this manual.

16 Time Delay Devices

Most timing devices used in modern equipment are fully sealed pneumatic or electronic types. These do not contain any user serviceable parts and maintenance should consist of

a visual inspection and checking of connection tightness. If available the control supply can be applied to prove the operation.

17 Overload Protection Devices

There are many types of overload protection devices the three most commonly used are:

- electronic
- thermal
- oil dashpot

17.1 Electronic overloads are normally fairly complex and this being the case have specific maintenance requirements. The literature for these, if fitted, will be found in the component literature section of this manual.

17.2 Thermal overloads require little maintenance other than a visual inspection and checking the connections for tightness, however it is adviseable to periodically electrically test them with a current injection test set and compare the results with the previous test results.

17.3 Oil dashpot devices require similar maintenance to thermal devices with the addition of checking the level and condition of the oil, the oil should always be topped up/replaced with the correct type as specified by the manufacturer.

18 Control Circuit Transformers

Control circuit transformers, having no moving parts, are generally very reliable and as such the only routine maintenance required is a visual inspection, checking of connections for tightness and if required checking the tightness of armature clamping bars.

19 Power Supply Units

Power supply units are generally sealed and have no user serviceable parts, the routine maintenance therefore being a visual inspection and checking the tightness of connections.

20 PLC’s

Overview

Allen-Bradley reactors help keep equipment running longer by absorbing many of the power line disturbances which can shut down your drive. Allen-Bradley isolation transformers can provide both voltage change and isolation for your variable speed drive. These designs are harmonic compensated and IGBT protected to assure optimum performance in the presence of harmonics.

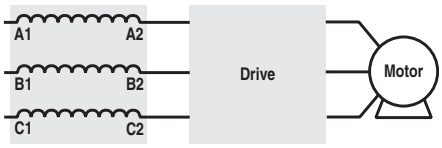
1321-3R and 3RA Series Line Reactors

Applying Allen-Bradley Line Reactors

At the Input of the Drive

At the input of a drive, line reactors help protect against surges or spikes on the incoming power lines and help reduce harmonic distortion.

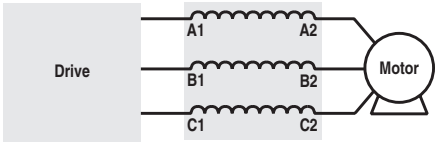
- Eliminate Nuisance Tripping
- Extend Semiconductor Life
- Reduce Harmonic Distortion
- Improve True Power Factor
- Reduce Voltage Notching
- Meet IEEE-519 or EN-61800



At the Output of the Drive

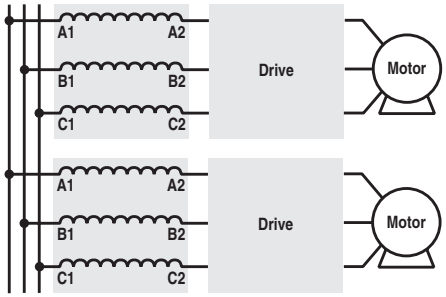
In long motor lead applications, Allen-Bradley load reactors located between the drive and motor help reduce dv/dt and motor terminal peak voltages. The use of a load reactor also helps protect the drive from surge currents caused by rapid changes in the load.

- Protect Motors from Long Lead Effects
- Reduce Output Voltage dv/dt
- Extend Semiconductor Life
- Reduce Surge Currents
- Reduce Motor Temperature
- Reduce Audible Motor Noise



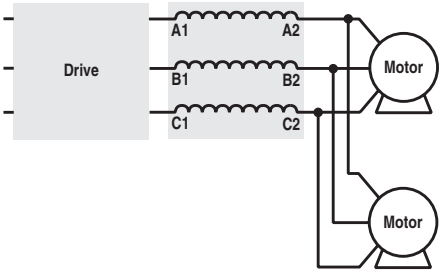
With Multiple Drives

Multiple drives on a common power line should each have their own line reactor. Individual line reactors provide filtering between each drive to help reduce any crosstalk while providing optimum surge protection for each drive.



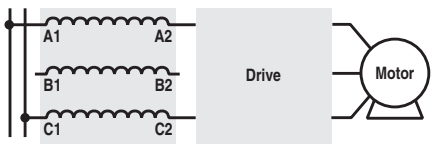
With Multiple Motors

When more than one motor is controlled by a single drive, a single line reactor can typically be used between the drive and all the motors. Size the line reactor based on the total motor/load horsepower.



With Single-Phase Input

A three-phase reactor can be used for single-phase applications by routing each of the two input power conductors to the outside two coils, and leaving the center coil disconnected. The sum of the inductance of the two coils is the total inductance applied to the circuit. Contact Rockwell Automation Technical Support for assistance in specifying the proper reactor.



1321-3R and 3RA Series Line Reactors

Selecting the Correct Impedance Rating

Why is the Right Impedance Rating Important?

Selecting the correct impedance rating is critical for your job. An impedance value too low may not limit peak current. Too high of an impedance may reduce input voltage. Allen-Bradley line reactors offer two impedance ratings.

3% Impedance Rated Reactors to Reduce Nuisance Trips

Allen-Bradley line reactors rated at 3% are typically sufficient to absorb line spikes and motor current surges and will help prevent nuisance tripping of drive and circuit breakers in most applications.

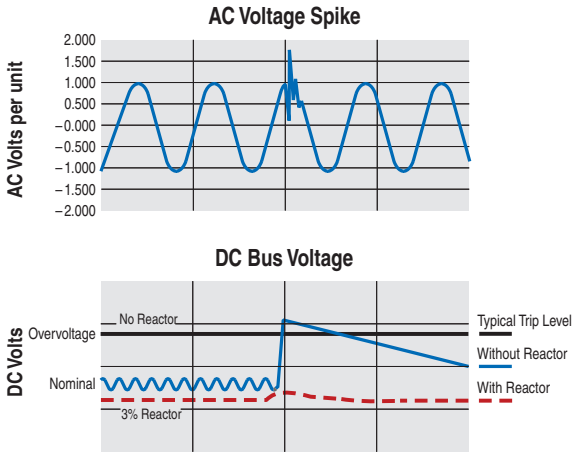
5% Impedance Rated Reactors to Reduce Harmonic Content

Allen-Bradley reactors rated at 5% are best for reducing harmonic current and frequencies. These line reactors help comply with IEEE-519 (not normally used as load reactors).

Voltage Spike Protection

Voltage spikes on AC power lines can cause elevation of the DC bus voltage which may cause the drive to trip on an overvoltage condition.

3% impedance reactors are very effective at protecting drives against voltage spikes and nuisance tripping. Allen-Bradley line reactors absorb these line spikes protecting the drive from nuisance tripping and damage.



Motor Protection

Allen-Bradley load reactors can help protect motors from high peak voltages.

For IGBT drive applications with long drive-to-motor lead lengths, Allen-Bradley load reactors can help protect against fast dv/dt rise times.

Common Specifications

Specification		Rating
Material	Enclosures	IP11 (NEMA/UL Type 1) — Sheet steel in accordance with UL, NEMA requirements
		IP00 (Open) or IP20 (Open - with finger safe terminals)
	Terminations	1-45 Amp (fundamental) Ratings – Finger guard IP20 terminal block
		80-160 Amp (fundamental) Ratings – Solid copper box lugs
		200-400 Amp (fundamental) Ratings – Copper tab terminals
		401 Amps and Above – Copper tab terminals
Harmonic Compensation	All line reactors are compensated for the additional currents and high frequencies caused by the presence of harmonics	
General Protection	Impedance	3% or 5% based on the fundamental current ratings
	Overload Rating	200% of fundamental current for 30 minutes 300% of fundamental current for 1 minute
	dv/dt Protection	Meets NEMA MG-1, part 31
Electrical	Max. Rated Voltage	600V AC (units with terminal blocks) 690V AC (units with box lugs or tab terminals)
	Max. Switching Freq.	20 kHz
	Fundamental Frequency	Line/Load - 50/60 Hz
	Temperature Rise	135 degrees C average
	Dielectric Strength	3,000 Volts rms (4,243 volts peak)
	Inductance Curve (Typical)	100% at 100% current 100% at 150% current 50% at 350% current (minimum)
	Inductance Tolerance	±10%
	Insulation System	Class N (200 degrees C)
	Impregnation	High bond strength solventless epoxy, 200 degrees C, UL94HB recognized
Environmental	Ambient Temperature	45 degrees C (maximum)
	Altitude	1000 meters (3280 feet)
Agency Approvals	UL-508	File E180243 Component Listed (1-2400 amps) File E180243 UL Listed NEMA Type 1 units (1-2400 amps) Note: Short Circuit rating not required under Exception No.1 of UL508A SB4.2.1 effective 4/25/06
	CSA C22.2, Class N, 200° C	File LR29753-13 CSA Certified (1 amp - 2400 amps) File E66214, Type 200-18, UL Recognized Insulation System
	CE	TUV certified to EN61558-2-20:2000

1321-3R and 3RA Series Line Reactors

Termination

Allen-Bradley reactors rated 45 Amps (fundamental) and below are supplied with an integral mounted terminal block. Reactors rated from 55 to 160 Amps (fundamental) are supplied with box lugs. Reactors rated 200 to 400 Amps (fundamental) will be supplied with front facing copper tabs. Above 400 Amps (fundamental), side facing copper tabs are used.

The "3R" and "3RA" designations for the 1321 line reactors indicate the following: 3R = Open Enclosure Line Reactor and 3RA = NEMA 1 Enclosure Line Reactor.

Sizing Guidelines

Fundamental amps are used for sizing the reactor to be equal to or slightly higher than the total motor FLA. Sizing reactors to drive ampere ratings alone may result in mis-sizing the reactor.

(1) Removable lifting rings are supplied with the unit.

1321 Reflective Wave Reduction (RWR) Devices

Description of Reflected Wave Phenomenon

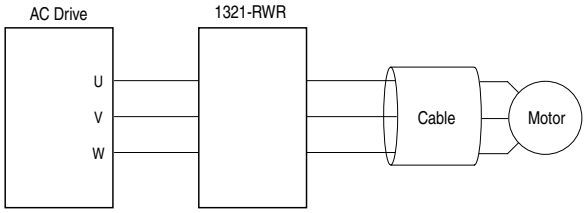
The inverter section of a drive does not produce sinusoidal voltage, but rather a series of voltage pulses created from the DC bus. These pulses travel down the motor cables to the motor and then reflected back to the drive. The reflection is dependant on the rise time of the drive output voltage, cable characteristics, cable length and motor impedance. If the voltage reflection is combined with another subsequent pulse, peak voltages can be at a destructive level. A single IGBT drive output may have reflected wave transient voltage stresses of up to twice (2 pu or per unit) the DC bus voltage between its own output wires. Multiple drive output wires in a single conduit or wire tray further increase output wire voltage stress between multi-drive output wires that are touching. Drive #1 may have a (+) 2 pu stress while drive #2 may simultaneously have a (–) 2 pu stress.

Refer to the *Wiring & Grounding Guidelines for PWM Drives* (publication DRIVES-IN001) for details.

Applying RWR Devices

At the Output of the Drive

In long motor lead applications, an Allen-Bradley 1321 RWR located between the drive and motor helps to reduce dv/dt and motor terminal peak voltages. The use of an RWR device also helps protect the drive from surge currents caused by rapid changes in the load.

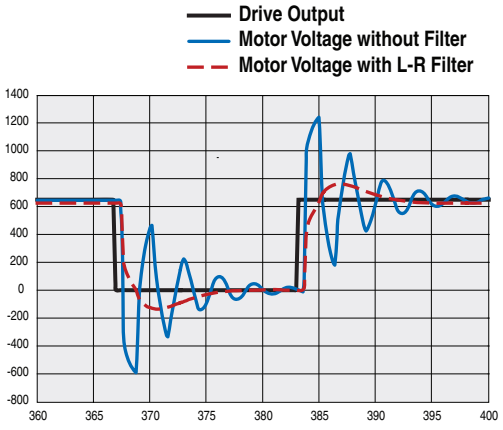


- Protect Motors from Long Lead Effects
- Reduce Output Voltage dv/dt
- Extend Semiconductor Life
- Reduce Surge Currents
- Reduce Motor Temperature
- Reduce Audible Motor Noise

Motor Protection

Allen-Bradley Reflective Wave Reduction devices can help protect motors from high peak voltages.

For IGBT drive applications with long drive-to-motor lead lengths, Allen-Bradley RWR devices can help protect against fast dv/dt rise times.



1321 Reflective Wave Reduction (RWR) Devices

Catalog Number Explanation

Important: 1321-RWR products replace existing 1204-RWR products. However, 1204-RWRC modules (RWR and Common Mode Choke assembly) are still available.

Specifications

Specification		Rating
Material	Enclosures	IP00 (Open)
	Terminations	1-45 Amp (fundamental) Ratings – Finger guard IP20 terminal block
		80-160 Amp (fundamental) Ratings – Solid copper box lugs
		200-400 Amp (fundamental) Ratings – Copper tab terminals
		401 Amps and Above – Copper tab terminals
Harmonic Compensation	All line reactors are compensated for the additional currents and high frequencies caused by the presence of harmonics	
General Protection	Impedance	3%
	Overload Rating	300% of fundamental current for (1) minute
IGBT Protection	First turn triple insulated offering protection up to 16kV	16,000 Volts per Microsecond dv/dt Protection 20 kHz Maximum Switching Frequency
Electrical	Max. Rated Voltage	600V AC, 50/60 Hz frequency
	Max. Switching Freq.	4 kHz
	Temperature Rise	115 degrees C.
	Dielectric Strength	4,000 Volts rms (5,600 volts peak)
	Inductance Curve	100% at 100% current, 100% at 150% current, 50% at 350% current
	Insulation System	Class H (180 degrees C or better)
	Impregnation	High bond strength epoxy impregnation, 4,000V high dielectric strength
Environmental	Ambient Temperature	45 degrees C.
	U.L. Listed	UL-508 - IP00, IP20, and IP11
	International	Conforms to VDE 0550
	CE	Not certified

1321 Reflective Wave Reduction (RWR) Devices

Termination

Allen-Bradley 1321 RWR devices rated 45 Amps (fundamental) and below are supplied with an integral mounted terminal block. Devices rated from 55 to 160 Amps (fundamental) are supplied with box lugs. Devices rated 200 to 400 Amps (fundamental) can be supplied with box lugs or copper tabs. Above 400 Amps (fundamental), solid copper tabs are used.

Approximate Dimensions, Weights, Wire Size and Terminal Blocks

Important: The dimensions and weights provided on the following page is for estimating purposes only. Contact your Allen-Bradley Sales Office if certified drawings are required for planning and installation.

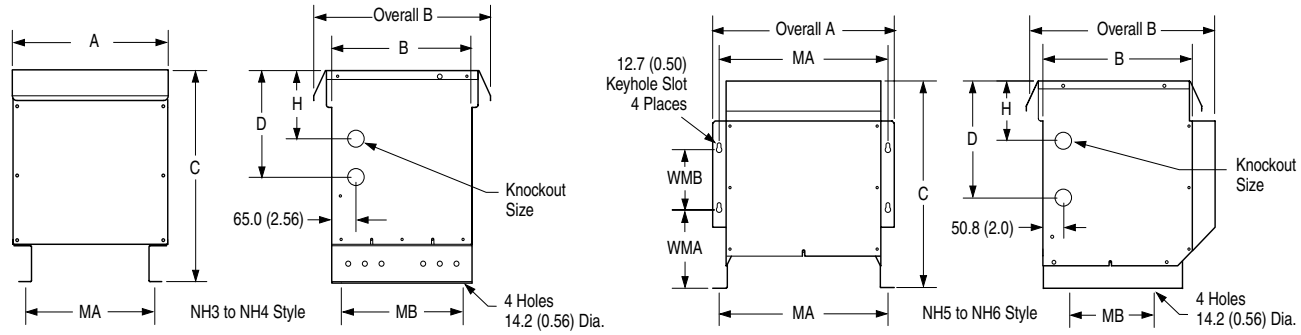
Construction	Enclosure	NEMA/UL Type 3R (IP32)
		Heavy duty ventilated enclosure with metal screens protecting all vents and finished in ANSI 61 grey
	Termination	Transformers up to 75kVA have integral high and low voltage lugs installed, suitable for copper or aluminum cable installation
	Conduit Entry	Standard knockouts on all enclosures
	Mounting	5-51 kVA units suitable for either floor or wall mounting. 63-75 kVA units suitable for floor, wall or ceiling mounting with mounting kit 1321-3TWM2 (Style NH3). Larger units are floor mount only
General	Impedance	4-6% impedance (nominal)
	Short Circuit Capability	Meets UL short circuit withstand capability
	Overload Rating	Windings designed to withstand overcurrent of 150% of rated load for 60 Seconds or 200% of rated load for 30 Seconds
	Duty Cycle	(1) start every (2) hours
	Thermostats	Thermostats with 1 N.C contact in each coil, wired in series and integral on all units
	K Factor	4
	Custom Options (consult factory for operating information)	50 Hz units
		Electrostatic shield (60dB attenuation typical)
		NEMA/UL Type 2 or IP20 (NEMA/UL Type 1)
		Core and coil construction (open)
		Additional HP or kVA sizes, voltages, extra primary taps, copper wound units, etc.

1321-3TH/3TW Series Three-Phase Isolation Transformers

Approximate Mounting Dimensions

IP32, NEMA/UL Type 3R - Styles NH3 through NH4



Dimensions in mm (in.)

Style	A	Overall A	B	Overall B	C	D	H	K	MA	MB	WMB	WMA
NH3	660.4 (26.00)	—	533.4 (21.00)	635.0 (25.00)	66.0 (38.00)	609.6 (24.00)	355.6 (14.00)	50.8 x 76.2 (2.00 x 3.00)	546.1 (21.50)	482.6 (19.00)	—	—
NH4	812.8 (32.00)	—	647.7 (25.50)	749.3 (29.50)	68.0 (41.00)	609.6 (24.00)	304.8 (12.00)	50.8 x 76.2 (2.00 x 3.00)	596.9 (23.50)	596.9 (23.50)	—	—
NH5 (1)	425.5 (16.75)	492.8 (19.40)	381.0 (15.00)	513.1 (20.20)	546.1 (21.50)	304.8 (12.00)	152.4 (6.00)	35.1 x 44.4 (1.38 x 1.75)	457.2 (18.00)	228.6 (9.00)	177.8 (7.00)	184.4 (7.26)
NH6 (1)	546.1 (21.50)	607.1 (23.90)	495.3 (19.50)	730.3 (28.75)	730.3 (28.75)	431.8 (17.00)	215.9 (8.50)	35.1 x 44.4 (1.38 x 1.75)	577.9 (22.75)	228.6 (9.00)	203.2 (8.00)	247.1 (9.73)

(1) Enclosure Styles NH1 and NH2 are replaced by NH5 and NH6 through 1321-3TH005 - 1321-3TH051 ratings.

1321-M Common Mode Chokes

1321-M Common Mode Chokes can be installed with 1305, 1336 PLUS II, 1336 IMPACT™ and PowerFlex® 70/700 AC drives. When installed at the drive output the common mode choke helps to guard against interference with other electrical equipment (Programmable Controllers, sensors, analog circuits, etc.). In addition, reducing the PWM carrier frequency reduces the effects and lowers the risk of common mode noise interference.

1321-DC DC Link Chokes

1321-DC DC Link Chokes can be installed with Frame C PowerFlex® 40 and all PowerFlex 400 drives. Add DC Link Chokes in series with the internal DC Bus to:

- Reduce AC Input Line Harmonics
- Help meet IEEE-519 limits
- Absorb Voltage/Current Spikes
- Reduce AC Ripple on DC Bus
- Reduce dV/dT and dI/dT rates
- Solve nuisance overvoltage tripping
- Reduce DC Bus Transient Overvoltage

Specifications

Specification	Rating
General	UL-508 component recognized (File E180243)
	1000 Volts DC maximum
	For ripple frequency of 300 Hz or 360 Hz
	50 degrees C temperature rise
	Suitable for 40 degrees C ambient temperature
	Class B insulation system (130 degrees C)
	Suitable for ripple current of 10% peak-to-peak
	Touchsafe terminals in many ratings

1321-DC DC Link Chokes

Special Features

- Solid copper box lug type terminals on most sizes
- Specially constructed and epoxy impregnated for low noise
- Customized ratings also available - contact the factory for custom mounting, inductance, current or ripple requirements

Rockwell Automation

Important User Information

Solid state equipment has operational characteristics differing from those of electromechanical equipment. *Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls* (Publication SGI-1.1 available from your local Rockwell Automation sales office or online at **http://www.rockwellautomation.com/literature**) describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc. is prohibited.

Throughout this manual, when necessary we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

Important: Identifies information that is critical for successful application and understanding of the product.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequences.

Shock Hazard labels may be located on or inside the equipment (e.g., drive or motor) to alert people that dangerous voltage may be present.

Burn Hazard labels may be located on or inside the equipment (e.g., drive or motor) to alert people that surfaces may be at dangerous temperatures.

Allen-Bradley, Rockwell Software, and TechConnect are trademarks of Rockwell Automation, Inc.

Trademarks not belonging to Rockwell Automation are property of their respective companies.

The information below summarizes the changes made to this manual since its last release (May 2007):

Description of Changes	Page
Reformatted document from half size (5.5 x 8.5 in.) to full size (8.5 x 11 in.)	Throughout manual
Revised Figures 2.2 and 2.3 to show PowerFlex 700H/S Frames 9 and larger. Added ground tab details in Figure 2.3.	2-4 and 2-5
Added “Flash Updating the Adapter” section.	3-18
Added information for use with PowerFlex 750-Series drives.	Throughout manual
Added “Using RSLinx Classic” section.	4-1
Revised Tables 4.A, 4.B, and 4.C to include configured settings for Parameters 13 - [DPI I/O Cfg], 25 - [M-S Input], and 26 - [M-S Output].	4-17
Added section “Limitations When Using PLC-5, SLC 500, and MicroLogix 1100.”	4-21
Added titles to the controller I/O image tables (Table 5.A through Table 5.F) for easier referral.	5-2 to 5-5
Added footnotes to explicit messaging screen configuration tables for all controller type examples to clarify required settings for the Size in Words/Elements/Bytes fields when reading/writing to 16-bit and 32-bit parameters.	Throughout Chapter 6
The 20-COMM-E adapter firmware version 4.001 added support for use with PowerFlex 750-Series drives (included related information where applicable).	Throughout Appendix C

Table of Contents

Preface **About This Manual**

Related Documentation P-1
Rockwell Automation Support P-2
Conventions Used in This Manual P-3

Chapter 1 **Getting Started**

Components. 1-1
Features 1-2
Compatible Products 1-3
Required Equipment 1-3
Safety Precautions. 1-4
Quick Start 1-5
Status Indicators 1-6

Chapter 2 **Installing the Adapter**

Preparing for an Installation 2-1
Setting the Web Pages Switch (Series B only) 2-2
Connecting the Adapter to the Drive. 2-3
Connecting the Adapter to the Network 2-6
Applying Power. 2-6
Commissioning the Adapter 2-8

Chapter 3 **Configuring the Adapter**

Configuration Tools. 3-1
Using the PowerFlex 7-Class HIM 3-2
Using BOOTP 3-3
Setting the IP Address, Subnet Mask, and Gateway Address. 3-6
Setting the Data Rate. 3-8
Setting the I/O Configuration 3-8
Selecting Master-Slave or Peer-to-Peer. 3-9
Setting the Reference Adjustment. 3-14
Setting a Fault Action 3-15
Setting Web Access Control 3-16
Resetting the Adapter 3-17
Viewing the Adapter Status Using Parameters 3-18
Flash Updating the Adapter 3-18

Chapter 4 **Configuring the I/O**

Using RSLinx Classic 4-1
ControlLogix Example 4-2
Limitations When Using PLC-5, SLC 500 or MicroLogix 1100/1400 4-21
PLC-5 Example. 4-22
SLC 500 Example 4-30
MicroLogix 1100/1400 Example 4-38

Chapter 5 Using the I/O
About I/O Messaging 5-1
Understanding the I/O Image 5-2
Using Logic Command/Status 5-5
Using Reference/Feedback 5-5
Using Datalinks 5-7
Example Ladder Logic Program Information 5-9
ControlLogix Example 5-10
PLC-5, SLC 500 or MicroLogix 1100/1400 Example 5-18

Chapter 6 Using Explicit Messaging
About Explicit Messaging 6-2
Performing Explicit Messages 6-3
ControlLogix Examples 6-4
PLC-5 Examples 6-23
SLC 500 Examples 6-29
MicroLogix 1100/1400 Examples 6-53

Chapter 7 Troubleshooting
Understanding the Status Indicators 7-1
PORT Status Indicator 7-2
MOD Status Indicator 7-2
NET A Status Indicator 7-3
NET B Status Indicator 7-3
Viewing Adapter Diagnostic Items 7-4
Viewing and Clearing Events 7-6

Chapter 8 Viewing the Adapter's Web Pages
Accessing the Adapter's Web Home Page 8-1
Process Display Pop-up Window 8-4
TCP/IP Configuration Web Page 8-5
Configure E-mail Notification Web Page 8-6
DPI Device Information Pages 8-9

Chapter 9 Using the Adapter in a DPI External Comms Kit (20-XCOMM-DC-BASE)
Installing the Adapter 9-1
I/O Board Option (20-XCOMM-IO-OPT1) 9-2
Understanding the I/O Image (Drive + I/O Option) 9-2
Configuring the Adapter to Use the Optional I/O Data 9-3
Viewing Optional I/O Diagnostic Items 9-4

Documentation can be obtained online at http://literature.rockwellautomation.com. To order paper copies of technical

documentation, contact your local Rockwell Automation distributor or sales representative.

To find your local Rockwell Automation distributor or sales representative, visit www.rockwellautomation.com/locations.

For information such as firmware updates or answers to drive-related questions, go to the Drives Service & Support web site at www.ab.com/support/abdrives and click on the “Downloads” or “Knowledgebase” link.

Rockwell Automation Support

Rockwell Automation, Inc. offers support services worldwide, with over 75 sales/support offices, over 500 authorized distributors, and over 250 authorized systems integrators located through the United States alone. In addition, Rockwell Automation, Inc. representatives are in every major country in the world.

Local Product Support

Contact your local Rockwell Automation, Inc. representative for:

- Sales and order support
- Product technical training
- Warranty support
- Support service agreements

Technical Product Assistance

For technical assistance, please review the information in Chapter 7, Troubleshooting, first. If you still have problems, then access the Allen-Bradley Technical Support web site at www.ab.com/support/abdrives or contact Rockwell Automation, Inc.

Conventions Used in This Manual

This manual provides information about the adapter and using it with PowerFlex 7-Class (Architecture-Class) drives. The adapter can be used with other products that support a DPI™ adapter, such as the DPI External Comms Kit (20-XCOMM-DC-BASE). Refer to the documentation for your product for specific information about how it works with the adapter.

The following conventions are used throughout this manual:

- Parameter names are shown in the format **Parameter xx - [*]**. The xx represents the parameter number. The * represents the parameter name—for example **Parameter 01 - [DPI Port]**.
- Menu commands are shown in bold type face and follow the format **Menu > Command**. For example, if you read "Select **File > Open**," you should click the **File** menu and then click the **Open** command.
- The firmware release is displayed as FRN X.xxx. The "FRN" signifies Firmware Release Number. The "X" is the major release number. The "xxx" is the minor update number.
- RSLinx (version 2.51), RSLogix 5 (version 7.20), RSLogix 500 (version 7.20), and RSLogix 5000 (version 16) were used for the screen shots in this manual. Different versions of the software may differ in appearance and procedures.

Notes:

Getting Started

The adapter is intended for installation into a PowerFlex 7-Class drive and is used for network communication. The Series B 20-COMM-E adapter (FRN 3.xxx or later) can also be installed in an External DPI Comms Kit (20-XCOMM-DC-BASE).

For PowerFlex 755 drives, it is recommended to use its embedded EtherNet/IP adapter instead of the 20-COMM-E adapter to take advantage of the embedded adapter's advanced capability. When used with PowerFlex 750-Series drives (including the PowerFlex 753 drive), the 20-COMM-E adapter must have firmware version 4.001 (or later) and must be installed using the 20-750-20COMM Option Card. This manual includes information on using the 20-COMM-E adapter with the PowerFlex 753 drive, but it also applies to the PowerFlex 755 drive.

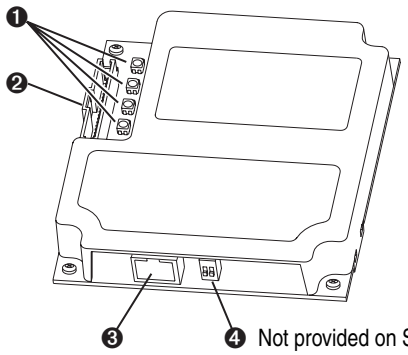
Quick Start	1-5
Status Indicators	1-6

Components

Figure 1.1 Components of the Adapter



Item	Part	Description
❶	Status Indicators	Four LEDs that indicate the status of the DPI, the adapter, and network connection. Refer to Chapter 7, Troubleshooting.
❷	DPI Connector	A 20-pin, single-row shrouded male header. An Internal Interface cable is connected to this connector and a connector on the drive.
❸	Ethernet Connector	An RJ-45 connector for the Ethernet cable. The connector is CAT-5 compliant to ensure reliable data transfer on 100Base-TX Ethernet connections.
❹	Web Pages Switch (SW2)	Enables or disables the adapter web pages. Refer to Setting the Web Pages Switch (Series B only) on page 2-2. SW1 is unused.

Features

The features of the adapter include:

- Typical mounting in a PowerFlex 7-Class drive. The Series B 20-COMM-E adapter (FRN 3.xxx or later) can also be installed in a DPI External Comms Kit and used with the kit's optional I/O board. See Chapter 9, Using the Adapter in a DPI External Comms Kit (20-XCOMM-DC-BASE) for more information.

  DPI External Comms Kit Compatibility

20-COMM-E Adapter		Operation With	
Series	Firmware Version	DPI External Comms Kit (20-XCOMM-DC-BASE)	Optional I/O Board (20-XCOMM-IO-OPT1)
A	2.xxx and earlier	No	No
B	3.xxx and later	Yes	Yes

- Captive screws to secure and ground the adapter to the drive or, when mounted in a DPI External Comms Kit, to the kit's metal enclosure.
- Compatibility with various configuration tools to configure the adapter and connected drive. The tools include the PowerFlex HIM on the drive, and drive-configuration software such as DriveExplorer (version 2.01 or later) or DriveExecutive (version 3.01 or later). In addition, you can use a BOOTP server to configure the network address for the adapter.
- Status indicators that report the status of the drive communications, the adapter, and network. They are visible when the drive cover is open or closed.
- Parameter-configured I/O (Logic Command/Reference and up to four pairs of Datalinks) to accommodate application requirements.
- Explicit Messaging support.
- Master-Slave or Peer-to-Peer hierarchy that can be set up so that the adapter and connected PowerFlex drive transmit data to and from either a scanner or another PowerFlex drive on the network.
- User-defined fault actions to determine how the adapter and connected PowerFlex drive respond to:
  - I/O messaging communication disruptions (Comm Flt Action)
  - Controllers in idle mode (Idle Flt Action)
- Web pages, viewed using a web browser, that show information about the adapter, connected drive, and other DPI devices connected to the drive.
- Configurable e-mail messaging to desired addresses when selected drive faults occur and/or are cleared, and/or when the adapter takes a communication or idle fault action.
- Access to any PowerFlex drive and its connected peripherals on the network to which the adapter is connected.

Compatible Products

DPI is a second generation peripheral communication interface and a functional enhancement to SCANport. The adapter is compatible with Allen-Bradley PowerFlex 7-Class drives and other products that support DPI. At the time of publication, compatible products include:

- PowerFlex 70/70EC drives
- PowerFlex 700/700VC drives
- PowerFlex 700H drives
- PowerFlex 700S drives
- PowerFlex 700L drives
- PowerFlex 750-Series drives [1]
- PowerFlex Digital DC drives
- DPI External Comms Kit
- SMC™ Flex

[1] The 20-COMM-E adapter must have firmware version 4.001 (or later) to be compatible with PowerFlex 750-Series drives.

Required Equipment

Equipment Shipped with the Adapter

When you unpack the adapter, verify that the package includes:

- ❑ One adapter
- ❑ A 2.54 cm (1 in.) and a 15.24 cm (6 in.) Internal Interface cable (only one cable is needed to connect the adapter to the drive; for which cable to use, see Figure 2.2 on page 2-4)
- ❑ One *PowerFlex 7-Class DPI (Drive Peripheral Interface) Network Communication Adapter Installation Instructions* (publication 20COMM-IN004)

TIP: When mounting the 20-COMM-E adapter in a PowerFlex 750-Series drive, you must use a 20-750-20COMM Option Card (publication 750COM-IN001) and the adapter must have firmware version 4.001 (or later).

User-Supplied Equipment

To install and configure the adapter, you must supply:

- ❑ A small flathead screwdriver
- ❑ Ethernet cable – refer to the *EtherNet/IP Media Planning and Installation Manual* (publication ENET-IN001)
- ❑ Ethernet switch – refer to the *EtherNet/IP Performance Application Solution* (publication ENET-AP001)
- ❑ Configuration tool, such as:
  - PowerFlex 7-Class HIM (20-HIM-xx)
  - DriveExplorer (version 2.01 or later)
  - DriveExecutive stand-alone software (version 3.01 or later) or bundled with the DriveTools SP suite (version 1.01 or later)
  - BOOTP Server (version 2.1 or higher) (network setup only)
- ❑ Controller configuration software (such as RSLogix 5/500/5000)
- ❑ A PC connection to the EtherNet/IP network

Safety Precautions

Please read the following safety precautions carefully.

ATTENTION: Risk of injury or death exists. The PowerFlex drive may contain high voltages that can cause injury or death. Remove all power from the PowerFlex drive, and then verify power has been discharged before installing or removing an adapter.

ATTENTION: Risk of injury or equipment damage exists. Only personnel familiar with drive and power products and the associated machinery should plan or implement the installation, start up, configuration, and subsequent maintenance of the product using an adapter. Failure to comply may result in injury and/or equipment damage.

ATTENTION: Risk of equipment damage exists. The adapter contains ESD (Electrostatic Discharge) sensitive parts that can be damaged if you do not follow ESD control procedures. Static control precautions are required when handling the adapter. If you are unfamiliar with static control procedures, refer to *Guarding Against Electrostatic Damage* (publication 8000-4.5.2).

ATTENTION: Risk of injury or equipment damage exists. If the adapter is transmitting control I/O to the drive, the drive may fault when you reset the adapter. Determine how your drive will respond before resetting an adapter.

ATTENTION: Risk of injury or equipment damage exists. **Parameters 21 - [Comm Flt Action]**, **22 - [Idle Flt Action]**, and **41 - [Peer Flt Action]** let you determine the action of the adapter and connected drive if communications are disrupted or the controller is idle. By default, these parameters fault the drive. You can set these parameters so that the drive continues to run. Precautions should be taken to ensure that the settings of these parameters do not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable or a faulted controller).

ATTENTION: Risk of injury or equipment damage exists. When a system is configured for the first time, there may be unintended or incorrect machine motion. Disconnect the motor from the machine or process during initial system testing.

ATTENTION: Risk of injury or equipment damage exists. The examples in this publication are intended solely for purposes of example. There are many variables and requirements with any application. Rockwell Automation, Inc. does not assume responsibility or liability (to include intellectual property liability) for actual use of the examples shown in this publication.

Quick Start

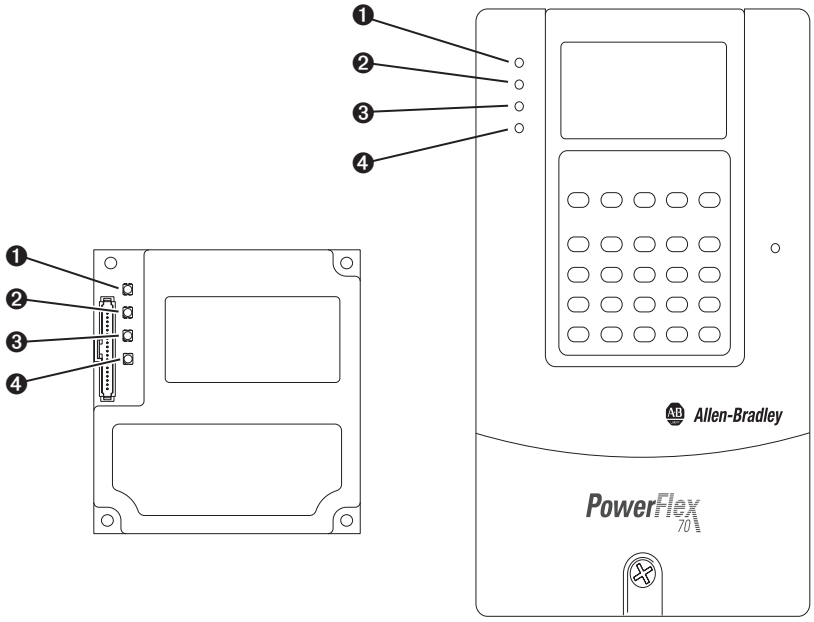
This section is provided to help experienced users quickly start using the adapter. If you are unsure how to complete a step, refer to the referenced chapter.

Step	Action	Refer to…
1	**Review the safety precautions for the adapter.**	Throughout This Manual
2	**Verify that the PowerFlex drive is properly installed.**	Drive User Manual
3	**Install the adapter.** Verify that the PowerFlex drive is not powered. Then, connect the adapter to the network using an Ethernet cable and to the drive using the Internal Interface cable. Use the captive screws to secure and ground the adapter to the drive. **NOTE:** When installing the adapter in a: • DPI External Comms Kit, refer to the *20-XCOMM-DC-BASE Installation Instructions* (publication 20COMM-IN001) supplied with the kit. • PowerFlex 750-Series drive, refer to the *20-750-20COMM Option Card Installation Instructions* (publication 750COM-IN001) supplied with the option card.	*PowerFlex 7-Class DPI Network Communication Adapter Installation Instructions* (publication 20COMM-IN004) and Chapter 2, Installing the Adapter
4	**Apply power to the adapter.** A. The adapter receives power from the drive. Verify that the adapter is installed correctly and then apply power to the drive. The status indicators should be green. If they flash red, there is a problem. Refer to Chapter 7, Troubleshooting. B. Configure/verify key drive parameters.	Chapter 2, Installing the Adapter
5	**Configure the adapter for your application.** Set adapter parameters for the following functions as required by your application: • IP address, subnet mask, and gateway address • Data rate • I/O configuration • Master-Slave or Peer-to-Peer hierarchy • Fault actions	Chapter 3, Configuring the Adapter
6	**Configure the controller to communicate with the adapter.** Use a controller configuration tool such as RSLogix to configure the master on the EtherNet/IP network to recognize the adapter and drive.	Chapter 4, Configuring the I/O
7	**Create a ladder logic program.** Use a controller configuration tool such as RSLogix to create a ladder logic program that enables you to: • Control the adapter and connected drive using I/O. • Monitor or configure the drive using Explicit messages.	Chapter 5, Using the I/O Chapter 6, Using Explicit Messaging

Status Indicators

The adapter uses four status indicators to report its operating status. They can be viewed on the adapter or through the drive cover (Figure 1.2).

Figure 1.2 Status Indicators (location on drive may vary)



Item	Name
❶	PORT
❷	MOD
❸	NET A
❹	NET B

After installing the adapter and applying power to the drive, refer to Start-Up Status Indications on page 2-6 for possible start-up status indications and their descriptions.

Installing the Adapter

This chapter provides instructions for installing the adapter in a PowerFlex 7-Class drive. This adapter can also be installed in a DPI External Comms Kit. In this case, refer to Chapter 9 or the separate *20-XCOMM-DC-BASE Installation Instructions* (publication 20COMM-IN001) supplied with the kit.

Topic	Page
Preparing for an Installation	2-1
Setting the Web Pages Switch (Series B only)	2-2
Connecting the Adapter to the Drive	2-3
Connecting the Adapter to the Network	2-6
Applying Power	2-6
Commissioning the Adapter	2-8

Preparing for an Installation

Before installing the adapter:

- Make sure the Ethernet switch is the correct type. A “managed” switch that supports IGMP snooping is usually recommended. An “unmanaged” switch can be used instead if RSLogix 5000 version 18 (or later) is used and all devices on the network are configured for “unicast” I/O. For more details, see the following documents:
  - *EtherNet/IP Media Planning and Installation Manual* (ODVA publication 148)
  - *EtherNet/IP Network Infrastructure Guidelines* (ODVA publication 35)
  - *EtherNet/IP Performance Application Solutions* (Rockwell publication ENET-AP001)
- Understand IGMP Snooping/Ethernet Switches

  The 20-COMM-E adapter is a multicast device. In most situations, an IGMP snooping (managed) switch is required. If more than one or two 20-COMM-E adapters are connected to the switch, a managed switch is required—otherwise the drive may fault on a DPI Port x network loss. The 20-COMM-E Series B adapter (firmware version 4.001 or later), RSLogix 5000 version 18 (or later), and a ControlLogix or CompactLogix controller will support unicast. When all ethernet connections are set up as unicast devices in RSLogix 5000, then an IGMP snooping (managed) switch is not needed.

  Much of EtherNet/IP implicit (I/O) messaging uses IP multicast to distribute I/O control data, which is consistent with the CIP producer/consumer model. Historically, most switches have treated multicast packets the same as broadcast packets. That is, all multicast packets are re-transmitted to all ports.

IGMP snooping constrains the flooding of multicast traffic by dynamically configuring switch ports so that multicast traffic is forwarded only to ports associated with a particular IP multicast group.

Switches that support IGMP snooping (managed switches) "learn" which ports have devices that are part of a particular multicast group and only forward the multicast packets to the ports that are part of the multicast group.

Be careful as to what level of support a switch has of IGMP snooping. Some layer 2 switches that support IGMP snooping require a router (which could be a layer 3 switch) to send out IGMP polls to learn what devices are part of the multicast group. Some layer 2 switches can use IGMP snooping without a router sending polls. If your control system is a stand-alone network or is required to continue performing if the router is out of service, make sure the switch you are using supports IGMP snooping without a router being present.

- Refer to Appendix A for the number of CIP connections supported by the 20-COMM-E adapter.
- Verify that you have all required equipment. Refer to Required Equipment on page 1-3.

Setting the Web Pages Switch (Series B only)

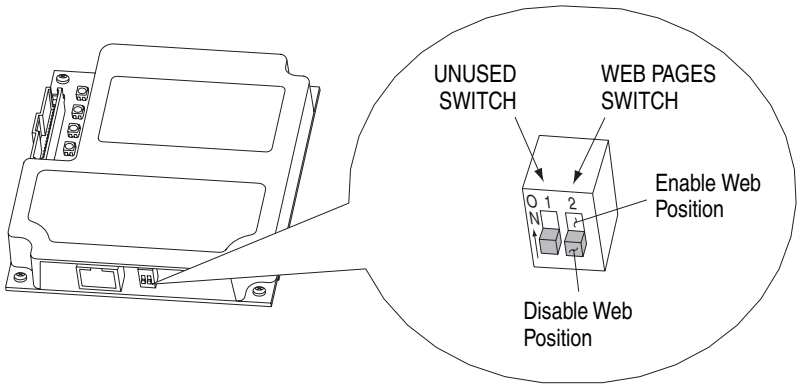
To use the adapter web pages, the Web Pages Switch (not provided on Series A adapter) must be set to its "Enable Web" position. For information to enable/disable web pages for a Series A adapter, refer to Setting Web Access Control on page 3-16.

Important: A new switch setting is recognized only when power is applied to the adapter, or the adapter is reset. If you change a switch setting, cycle power or reset the adapter to apply the change.

ATTENTION: Risk of equipment damage exists. The adapter contains ESD (Electrostatic Discharge) sensitive parts that can be damaged if you do not follow ESD control procedures. Static control precautions are required when handling the adapter. If you are unfamiliar with static control procedures, refer to *Guarding Against Electrostatic Damage* (publication 8000-4.5.2).

Set the Web Pages Switch (SW2 in Figure 2.1) to enable or disable the adapter web pages. By default, the adapter web pages are disabled. For complete details on adapter web pages, see Viewing the Adapter's Web Pages on page 8-1.

Figure 2.1 Setting Web Pages Switch



SW2 Setting	Description
Down (OFF) position	Disables the adapter web pages (default setting)
Up (ON) position	Enables the adapter web pages

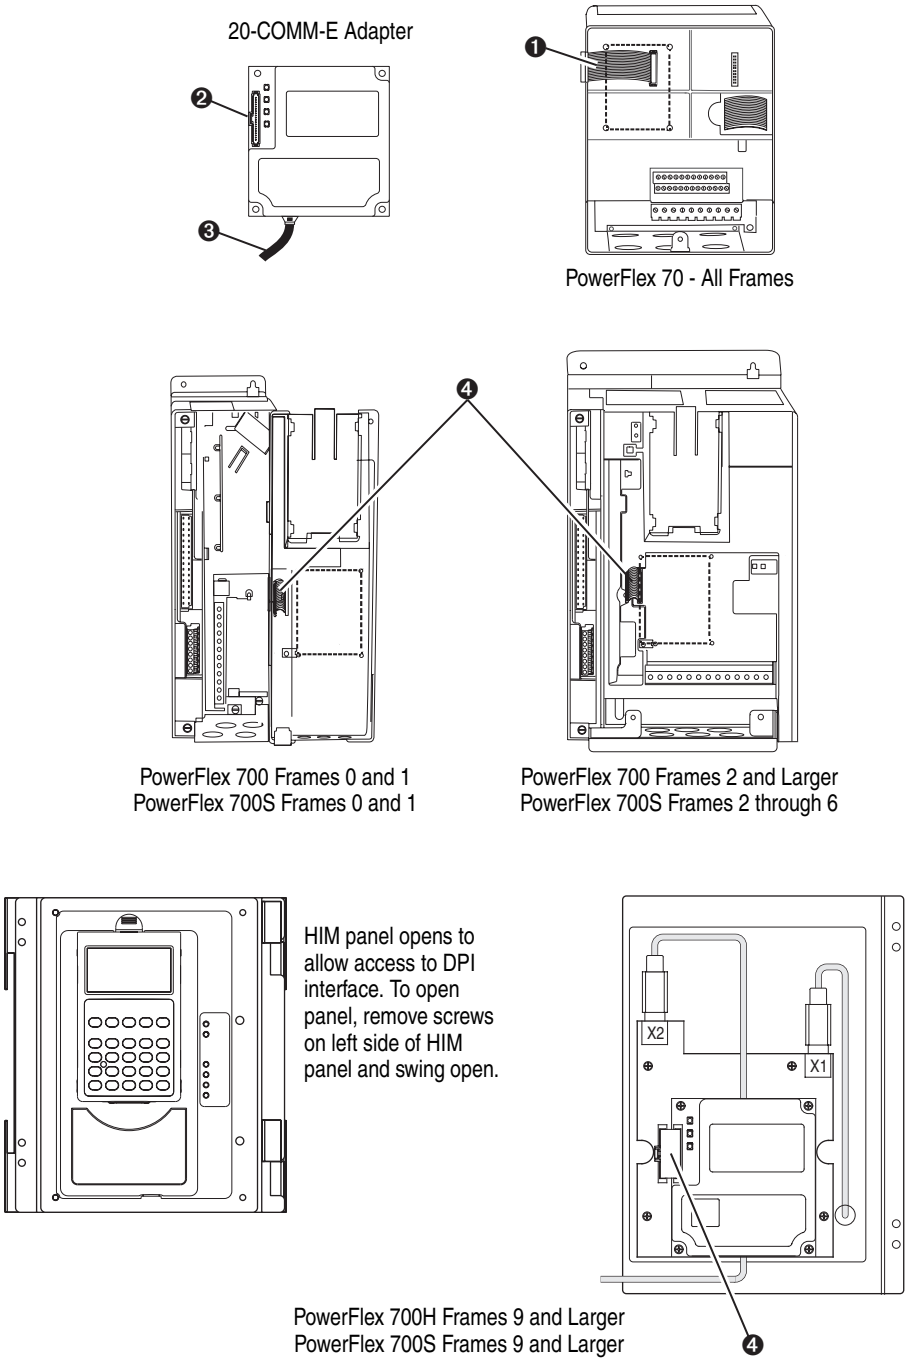
Connecting the Adapter to the Drive

ATTENTION: Risk of injury or death exists. The PowerFlex drive may contain high voltages that can cause injury or death. Remove power from the drive, and then verify power has been discharged before installing or removing the adapter.

1. Remove power from the drive.
2. Use static control precautions.
3. Remove the drive cover or open the drive door.
4. Connect the Internal Interface cable to the DPI port on the drive and then to the DPI connector on the adapter (see Figure 2.2).
5. Secure and ground the adapter to the drive (see Figure 2.3) by doing the following:
   - On a PowerFlex 70 drive, fold the Internal Interface cable behind the adapter and mount the adapter on the drive using the four captive screws.
   - On a PowerFlex 700, PowerFlex 700H or PowerFlex 700S drive, mount the adapter on the drive using the four captive screws.

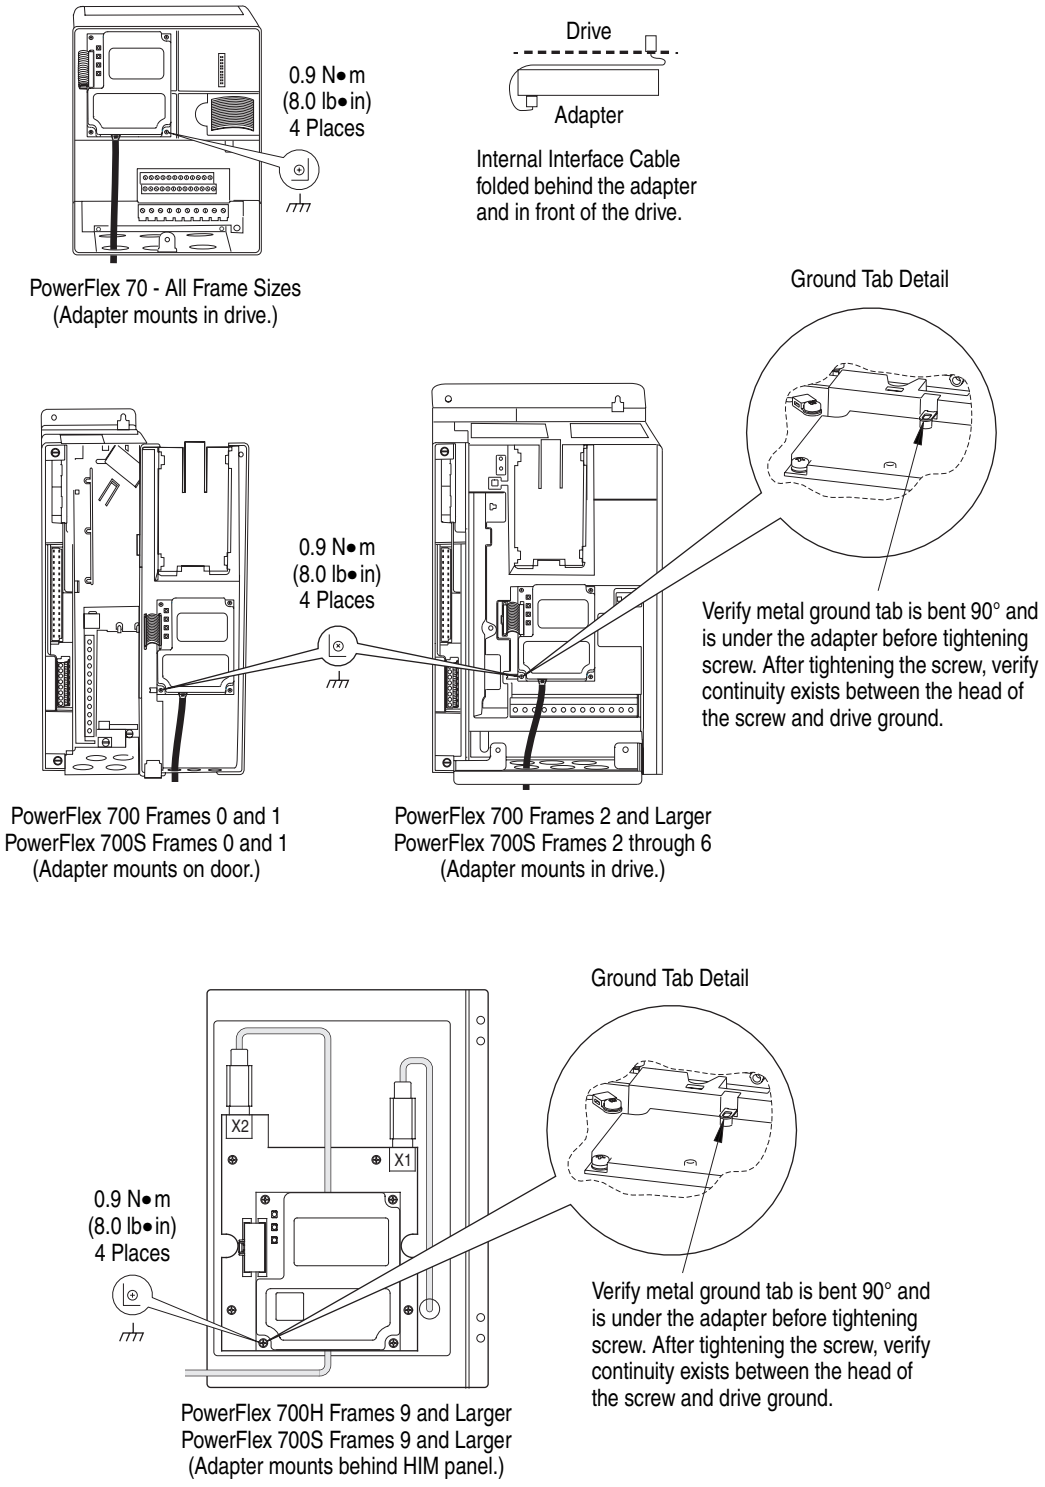
Important: Tighten all screws to properly ground the adapter. Recommended torque is 0.9 N•m (8.0 lb•in).

Figure 2.2 DPI Ports and Internal Interface Cables



Item	Description
❶	15.24 cm (6 in.) Internal Interface cable
❷	DPI Connector
❸	Ethernet cable
❹	2.54 cm (1 in.) Internal Interface cable

Figure 2.3 Mounting and Grounding the Adapter



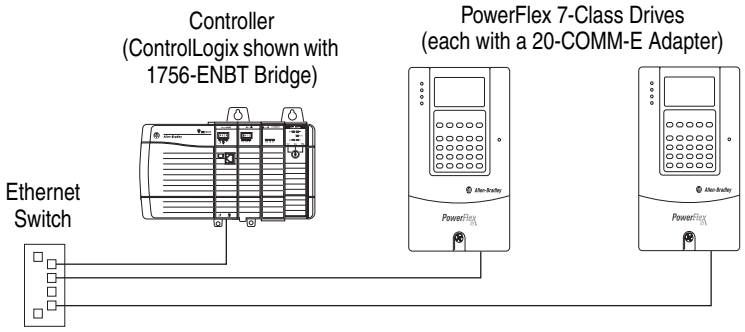
NOTE: When installing the adapter in a PowerFlex 750-Series drive, refer to the *20-750-20COMM Option Card Installation Instructions* (publication 750COM-IN001) supplied with the option card.

Connecting the Adapter to the Network

ATTENTION: Risk of injury or death exists. The PowerFlex drive may contain high voltages that can cause injury or death. Remove power from the drive, and then verify power has been discharged before installing or removing the adapter.

1. Remove power from the drive.
2. Use static control precautions.
3. Connect one end of an Ethernet cable to the network. See Figure 2.4 for an example of wiring to an EtherNet/IP network.

Figure 2.4 Connecting the Ethernet Cable to the Network



4. Route the other end of the Ethernet cable through the bottom of the PowerFlex drive (Figure 2.3) and insert its Ethernet cable plug into the mating adapter receptacle.

Applying Power

ATTENTION: Risk of equipment damage, injury, or death exists. Unpredictable operation may occur if you fail to verify that parameter settings are compatible with your application. Verify that settings are compatible with your application before applying power to the drive.

Install the drive cover or close the drive door, and apply power to the drive. The adapter receives its power from the connected drive. When you apply power to the adapter for the first time, its topmost "PORT" status indicator should be steady green or flashing green after an initialization. If it is red, there is a problem. Refer to Chapter 7, Troubleshooting.

Start-Up Status Indications

After power has been applied, the status indicators for the drive and communications adapter can be viewed on the front of the drive (Figure 2.5). Possible start-up status indications are shown in Table 2.A.

Figure 2.5 Drive and Adapter Status Indicators (location on drive may vary)

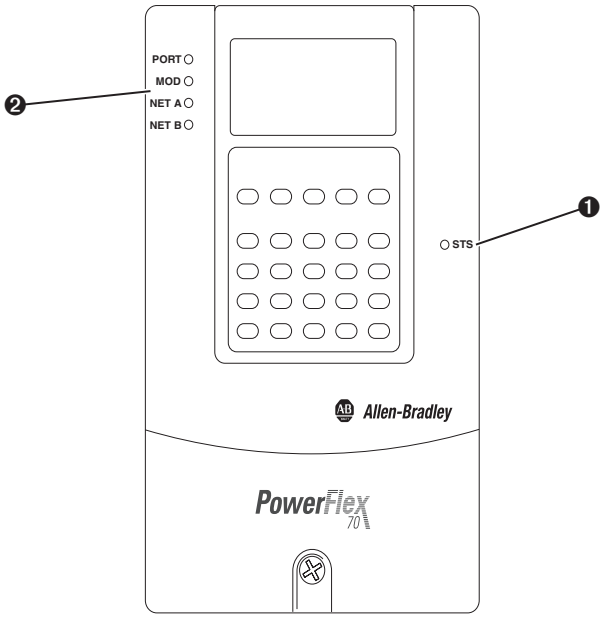


Table 2.A Drive and Adapter Start-Up Status Indications

Item	Name	Color	State	Description
Drive STS Indicator				
❶	STS (Status)	Green	Flashing	Drive ready but not running, and no faults are present.
			Steady	Drive running, no faults are present.
		Yellow	Flashing, Drive Stopped	An inhibit condition exists – the drive cannot be started. Check drive Parameter 214 - [Start Inhibits].
			Flashing, Drive Running	An intermittent type 1 alarm condition is occurring. Check drive Parameter 211 - [Drive Alarm 1].
			Steady, Drive Running	A continuous type 1 alarm condition exists. Check drive Parameter 211 - [Drive Alarm 1].
		Red	Flashing	A fault has occurred.
			Steady	A non-resettable fault has occurred.
Adapter Status Indicators				
❷	PORT	Green	Flashing	Normal Operation. The adapter is establishing an I/O connection to the drive. It will turn steady green or red.
			Steady	Normal Operation. The adapter is properly connected and communicating with the drive.
	MOD	Green	Flashing	Normal Operation. The adapter is operating but is not transferring I/O data to a controller.
			Steady	Normal Operation. The adapter is operating and transferring I/O data to a controller.
	NET A	Green	Off	Normal operation. BOOTP is enabled or a valid IP address is not set.
			Flashing	Normal Operation. BOOTP is disabled, the adapter is properly connected, has an IP address, and is connected to an EtherNet/IP network but does not have an I/O connection.
			Steady	Normal Operation. The adapter is properly connected and communicating on the network to a controller.
	NET B	Green	Off	Normal Operation. The adapter is properly connected but is idle.
			Flashing	Normal Operation. The adapter is properly connected, BOOTP is enabled, and the adapter is transmitting data packets on the network.

For more details on status indicator operation, refer to page 7-2 and page 7-3.

Configuring/Verifying Key Drive Parameters

The PowerFlex 7-Class drive can be separately configured for the control and Reference functions in various combinations. For example, you could set the drive to have its control come from a peripheral or terminal block with the Reference coming from the network. Or you could set the drive to have its control come from the network with the Reference coming from another peripheral or terminal block. Or you could set the drive to have both its control and Reference come from the network.

The following steps in this section assume that the drive will receive the Logic Command and Reference from the network.

1. Use drive Parameter 090 - [Speed Ref A Sel] to set the drive speed Reference to “22” (DPI Port 5).
2. If hard-wired discrete digital inputs are not used to control the drive, verify that unused digital input drive Parameters 361 - [Dig In1 Sel] and 362 - [Dig In2 Sel] are set to “0” (Not Used).
3. Verify that drive Parameter 213 - [Speed Ref Source] is reporting that the source of the Reference to the drive is “22” (DPI Port 5). This ensures that any Reference commanded from the network can be monitored by using drive Parameter 002 - [Commanded Speed]. If a problem occurs, this verification step provides the diagnostic capability to determine whether the drive/adapter or the network is the cause.

▶ **TIP:** For PowerFlex 750-Series drives, use drive Parameter 545 - [Speed Ref A Sel] to set the drive speed Reference:

A. Set the Port field to “Port 0 - PowerFlex 75x.”

B. Set the Parameter field to point to the port in which the 20-COMM-E adapter/20-750-20COMM Option Card are installed (for example, “876 - Port 6 Reference”).

Commissioning the Adapter

To commission the adapter, you must set a unique IP address on the network. (Refer to the Glossary for details about IP addresses.) After installing the adapter and applying power, you can set the IP address by using a BOOTP server or by setting adapter parameters. See Setting the IP Address, Subnet Mask, and Gateway Address on page 3-6 for details.

By default, the adapter is configured so that you must set the IP address using a BOOTP server. To set the IP address using adapter parameters, you must disable the BOOTP feature. See Disabling the BOOTP Feature on page 3-6 for details.

Important: New settings for some adapter parameters (for example, **Parameters 04 - [IP Addr Cfg 1]** through **07 - [IP Addr Cfg 4]**) are recognized only when power is applied to the adapter or it is reset. After you change parameter settings, cycle power or reset the adapter.

Configuring the Adapter

This chapter provides instructions and information for setting the parameters in the adapter.

Topic	Page
Configuration Tools	3-1
Using the PowerFlex 7-Class HIM	3-2
Using BOOTP	3-3
Setting the IP Address, Subnet Mask, and Gateway Address	3-6
Setting the Data Rate	3-8
Setting the I/O Configuration	3-8
Selecting Master-Slave or Peer-to-Peer	3-9
Setting the Reference Adjustment	3-14
Setting a Fault Action	3-15
Setting Web Access Control	3-16
Resetting the Adapter	3-17
Viewing the Adapter Status Using Parameters	3-18
Flash Updating the Adapter	3-18

For a list of parameters, refer to Appendix B, Adapter Parameters. For definitions of terms in this chapter, refer to the Glossary.

Configuration Tools

The adapter stores parameters and other information in its own non-volatile memory. You must, therefore, access the adapter to view and edit its parameters. The following tools can be used to access the adapter parameters:

Tool	Refer to…
PowerFlex 7-Class HIM	page 3-2
BOOTP Server	page 3-3
DriveExplorer Software (version 2.01 or later)	http://www.ab.com/drives/driveexplorer, or DriveExplorer online help (installed with the software)
DriveExecutive Software (version 3.01 or later)	http://www.ab.com/drives/drivetools, or DriveExecutive online help (installed with the software)

Using the PowerFlex 7-Class HIM

If your drive has either an LED or LCD HIM (Human Interface Module), it can be used to access parameters in the adapter as shown below. It is recommended that you read through the steps for your HIM before performing the sequence. For additional information, refer to the drive documentation or the *PowerFlex 7-Class HIM Quick Reference* (publication 20HIM-QR001).

Using an LED HIM

Step	Example Screens
1. Press the ALT key and then the Device Sel (Sel) key to display the Device Screen. 2. Press the ▲ or ▼ key to scroll to the adapter. Letters represent files in the drive, and numbers represent ports. The adapter is usually connected to port 5. 3. Press the ↵ (Enter) key to enter your selection. A parameter database is constructed, and then the first parameter is displayed. 4. Edit the parameters using the same techniques that you use to edit drive parameters.	

Using an LCD HIM

Step	Example Screens
1. In the main menu, press the ▲ or ▼ key to scroll to **Device Select**. 2. Press the ↵ (Enter) key to enter your selection. 3. Press the ▲ or ▼ key to scroll to the adapter (20-COMM-E). 4. Press the ↵ (Enter) key to select the adapter. A parameter database is constructed, and then the main menu for the adapter is displayed. 5. Edit the parameters using the same techniques that you use to edit drive parameters.	
NOTE: All configuration procedures throughout this chapter use the PowerFlex 7-Class LCD HIM to access parameters in the adapter and show example LCD HIM screens.

TIP: When using a PowerFlex 20-HIM-A6 or 20-HIM-C6S HIM, refer to its User Manual, publication 20-HIM-UM001).

Using BOOTP

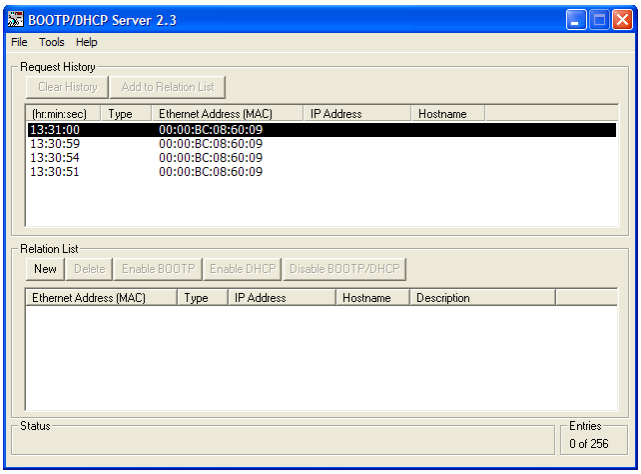
By default, the adapter is configured so that you can set its IP address, subnet mask, and gateway address by using a BOOTP utility. You can select from a variety of BOOTP utilities. These instructions use Rockwell's BOOTP Server (version 2.3 or later), a free stand-alone program that incorporates the functionality of standard BOOTP utilities with a graphical interface. It is available from http://www.software.rockwell.com/support/download/detail.cfm?ID=3390. Refer to the Readme file and online Help for directions and more information.

TIP: If desired, you can disable BOOTP and configure the IP address, subnet mask, and gateway address by setting parameters. For details, see Setting the IP Address, Subnet Mask, and Gateway Address on page 3-6.

Configuring the Adapter Using BOOTP Server

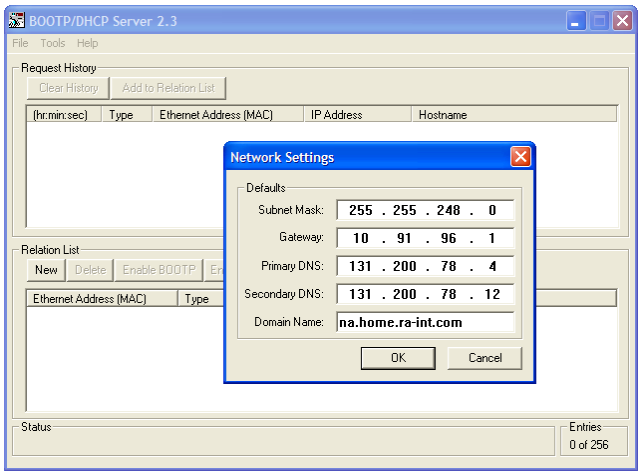
1. On the adapter label, note the adapter's hardware Ethernet Address (MAC), which will be used in Step 6.
2. On a computer connected to the EtherNet/IP network, start the BOOTP software. The BOOTP Server window (Figure 3.1) appears.

Figure 3.1 BOOTP Server Window



3. To properly configure devices on your EtherNet/IP network, you must configure settings in the BOOTP software to match the network. Select **Tools > Network Settings** to display the Network Settings window (Figure 3.2).

Figure 3.2 Network Settings Window



4. Edit the following:

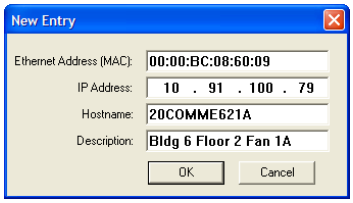
Box	Type
Subnet Mask (1)	The subnet mask for the adapter's network.
Gateway (1)	The IP address of the gateway device on the adapter's network.
Primary DNS	The address of the primary DNS server to be used on the local end of the link for negotiating with remote devices.
Secondary DNS	Optional — the address of the secondary DNS server to be used on the local end of the link for negotiating with remote devices when the primary DNS server is unavailable.
Domain Name	The text name corresponding to the numeric IP address that was assigned to the server that controls the network.

(1) For definitions of these terms, refer to the Glossary.

5. Click **OK** to apply the settings. Devices on the network issuing BOOTP requests appear in the BOOTP Request History list.

6. In the BOOTP Request History list, either double-click the adapter's Ethernet Address (MAC) noted in Step 1, or click **New** in the Relation List. The New Entry dialog box (Figure 3.3) appears. In the first case, the Ethernet Address (MAC) is automatically entered. In the latter case, you must manually enter it.

Figure 3.3 New Entry Dialog Box



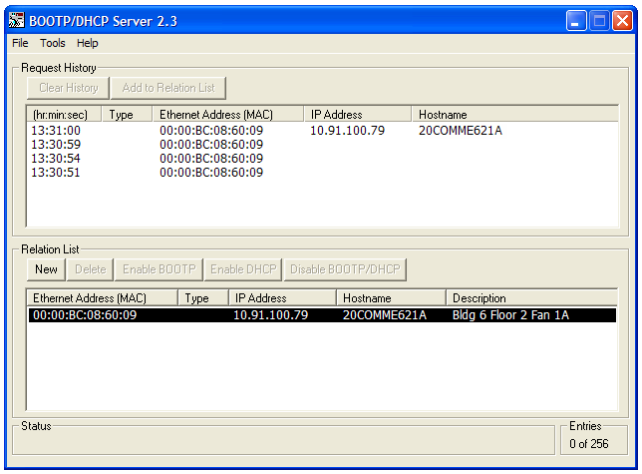
7. Edit the following:

Box	Type
IP Address [1]	A unique IP address for the adapter
Host Name	Optional
Description	Optional

[1] For a definition of this term, refer to the Glossary.

8. Click **OK** to apply the settings. The adapter appears in the Relation List (Figure 3.4) with the new settings.

Figure 3.4 BOOTP Server Window with Adapter in the Relation List



9. To assign this configuration to the adapter permanently, select the device in the Relation List and click **Disable BOOTP/DHCP**. When power is cycled on the adapter, it will use the configuration you assigned it and not issue new BOOTP requests.

TIP: To enable BOOTP for an adapter that has had BOOTP disabled, first select the adapter in the Relation List, then click **Enable BOOTP**, and finally reset the adapter or power cycle the drive.

10. To save the Relation List, select **File > Save**.

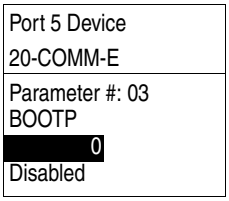
Setting the IP Address, Subnet Mask, and Gateway Address

By default, the adapter is configured so that you set its IP address, subnet mask, and gateway address using a BOOTP server. If you want to set these attributes using the adapter parameters instead, you must disable BOOTP and then set the appropriate parameters in the adapter.

Disabling the BOOTP Feature

1. Set the value of **Parameter 03 - [BOOTP]** to "0" (Disabled).

Figure 3.5 Example BOOTP LCD HIM Screen



Value	Setting
0	Disabled
1	Enabled (Default)

2. Reset the adapter (see Resetting the Adapter on page 3-17).

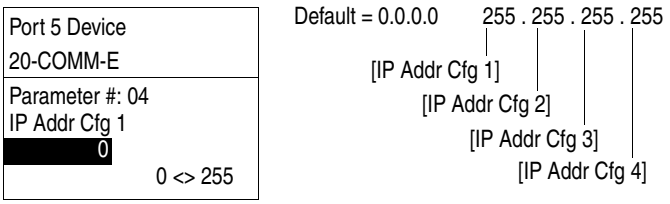
   After disabling the BOOTP feature, you can then configure the IP address, subnet mask, and gateway address using adapter parameters.

Setting an IP Address Using Parameters

1. Verify that **Parameter 03 - [BOOTP]** is set to "0" (Disabled). This parameter must be set to Disabled to configure the IP address using the adapter parameters.

2. Set the value of **Parameters 04 - [IP Addr Cfg 1]** through **07 - [IP Addr Cfg 4]** to a unique IP address.

Figure 3.6 Example IP Addr Cfg 1 LCD HIM Screen



3. Reset the adapter (see Resetting the Adapter on page 3-17).

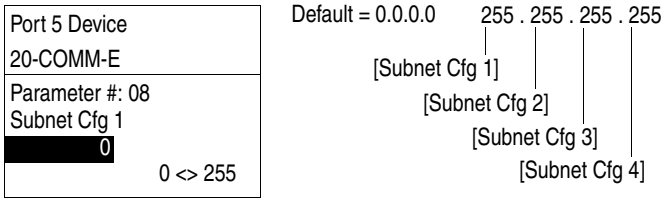
   The NET A status indicator will be steady green or flashing green if the IP address is correctly configured, and is connected to an operating ethernet network.

Setting a Subnet Mask Using Parameters

1. Verify that **Parameter 03 - [BOOTP]** is set to “0” (Disabled). This parameter must be set to Disabled to configure the subnet mask using the adapter parameters.

2. Set the value of **Parameters 08 - [Subnet Cfg 1]** through **11 - [Subnet Cfg 4]** to the desired value for the subnet mask.

Figure 3.7 Example Subnet Cfg 1 LCD HIM Screen



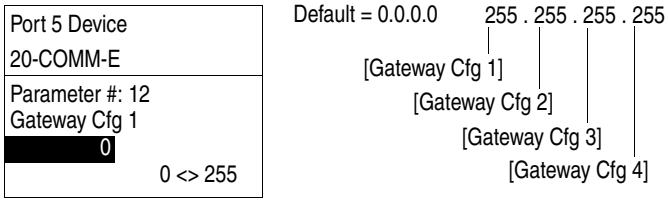
3. Reset the adapter (see Resetting the Adapter on page 3-17).

Setting a Gateway Address for the Adapter Using Parameters

1. Verify that **Parameter 03 - [BOOTP]** is set to “0” (Disabled). This parameter must be set to Disabled to configure the gateway address using the adapter parameters.

2. Set the value of **Parameters 12 - [Gateway Cfg 1]** through **15 - [Gateway Cfg 4]** to the IP address of the gateway device.

Figure 3.8 Example Gateway Cfg 1 LCD HIM Screen



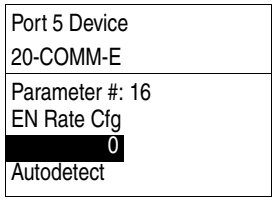
3. Reset the adapter (see Resetting the Adapter on page 3-17).

Setting the Data Rate

By default, the adapter is set to autodetect, so it automatically detects the data rate and duplex setting used on the network. If you need to set a specific data rate and duplex setting, the value of **Parameter 16 - [EN Rate Cfg]** determines the Ethernet data rate and duplex setting that the adapter will use to communicate. For definitions of data rate and duplex, refer to the Glossary.

1. Set the value of **Parameter 16 - [EN Rate Cfg]** to the data rate at which your network is operating.

Figure 3.9 Example Ethernet Rate Cfg LCD HIM Screen



Value	Data Rate
0	Autodetect (default)
1	10 Mbps Full
2	10 Mbps Half
3	100 Mbps Full
4	100 Mbps Half

TIP: Auto detection of baud rate and duplex works properly only if the device (usually a switch) on the other end of the cable is also set to auto detect the baud rate/duplex. If one device has the baud rate/duplex hard coded, the other device must be hard-coded to the same settings.

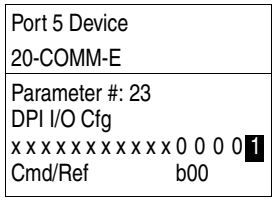
2. Reset the adapter (see Resetting the Adapter on page 3-17).

Setting the I/O Configuration

The I/O configuration determines the data that is sent to and from the drive. Logic Command/Status, Reference/Feedback, and Datalinks may be enabled or disabled. (Datalinks allow you to read/write directly to parameters in the drive using implicit I/O.) A “1” enables the I/O and a “0” disables the I/O.

1. Set the bits in **Parameter 23 - [DPI I/O Cfg]**.

Figure 3.10 Example DPI I/O Cfg LCD HIM Screen



Bit	Description
0	Logic Command/Reference (Default)
1	Datalink A
2	Datalink B
3	Datalink C
4	Datalink D
5…15	Not Used

Bit 0 is the right-most bit. In Figure 3.10, it is highlighted and equals “1.”

2. If a controller is used to control the drive, adapter **Parameters 35 - [M-S Input]** and **36 - [M-S Output]** for Master-Slave Hierarchy must be set (see Setting a Master-Slave Hierarchy (Scanner-to-Drive Communication) on page 3-9).

3. If Logic Command/Reference is enabled, configure the parameters in the drive to accept the Logic Command and Reference from the adapter.

For example, set Parameter 90 - [Speed Ref A Sel] in a PowerFlex 70 or 700 drive to “22” (DPI Port 5) so that the drive uses the Reference from the adapter. Also, verify that the mask parameters (for example, Parameter 276 - [Logic Mask]) in the drive are configured to receive the desired logic from the adapter. Refer to the documentation for your drive for details.

4. If you enabled one or more Datalinks, configure parameters in the drive to determine the source and destination of data in the Datalink(s). When using Datalinks, up to 8 drive [Data In xx] parameters (300…307) and/or up to 8 [Data Out xx] parameters (310…317) must be assigned to point to the appropriate drive parameters for your application. See Chapter 4 for an example.

5. Reset the adapter (see Resetting the Adapter on page 3-17).

The adapter is ready to receive I/O. You must now configure the adapter to receive I/O from a master or peer device. See Selecting Master-Slave or Peer-to-Peer. If you select a Master-Slave hierarchy, you must also configure the master to communicate with the adapter. See Chapter 4, Configuring the I/O.

Selecting Master-Slave or Peer-to-Peer

A hierarchy determines the type of device with which the adapter exchanges data. In a Master-Slave hierarchy, the adapter exchanges data with a master, such as a scanner or bridge (1756-ENBT, 1756-EN2T, 1747-L5-xxx, etc.). In a Peer-to-Peer hierarchy, the adapter exchanges data with one or more EtherNet/IP adapters connected to other drives. (The drives must have compatible Logic Command/Status words.)

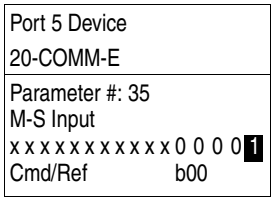
For both Master-Slave and Peer-to-Peer hierarchies, the devices exchanging data must be on the same IP subnet. See “IP Addresses” in the Glossary for information about IP subnets.

Setting a Master-Slave Hierarchy (Scanner-to-Drive Communication)

1. Enable the desired I/O in **Parameter 23 - [DPI I/O Cfg]**. See Figure 3.10.

2. Set the bits in **Parameter 35 - [M-S Input]**. This parameter determines the data received from the master by the drive. A “1” enables the I/O and a “0” disables the I/O.

Figure 3.11 Example M-S Input LCD HIM Screen

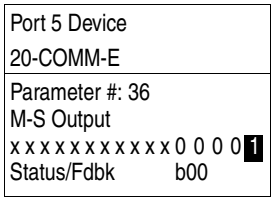


Bit	Description
0	Logic Command/Reference (Default)
1	Datalink A Input
2	Datalink B Input
3	Datalink C Input
4	Datalink D Input
5…15	Not Used

Bit 0 is the right-most bit. In Figure 3.11, it is highlighted and equals “1.”

3. Set the bits in **Parameter 36 - [M-S Output]**. This parameter determines the data transmitted from the drive to the scanner. A "1" enables the I/O and a "0" disables the I/O.

Figure 3.12 Example M-S Output LCD HIM Screen



Bit	Description
0	Status/Feedback (Default)
1	Datalink A Output
2	Datalink B Output
3	Datalink C Output
4	Datalink D Output
5...15	Not Used

Bit 0 is the right-most bit. In Figure 3.12, it is highlighted and equals "1."

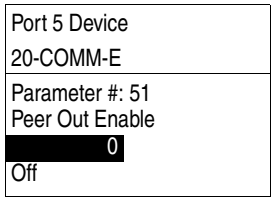
4. Reset the adapter (see Resetting the Adapter on page 3-17).

The adapter is ready to receive I/O from the master (that is, scanner). You must now configure the scanner to recognize and transmit I/O to the adapter. See Chapter 4, Configuring the I/O.

Setting the Adapter to Transmit Peer-to-Peer Data (Drive-to-Drive Communication)

1. Verify that **Parameter 51 - [Peer Out Enable]** is set to "0" (Off). This parameter must be Off while you configure peer output parameters.

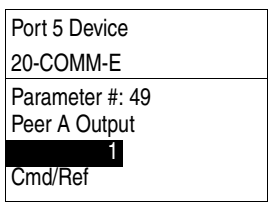
Figure 3.13 Example Peer Out Enable LCD HIM Screen



Value	Setting
0	Off (Default)
1	On

2. Set **Parameter 49 - [Peer A Output]** to select the source of the data to output to the network.

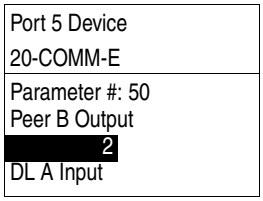
Figure 3.14 Example Peer A Output LCD HIM Screen



Value	Description
0	Off (Default)
1	Logic Command/Reference
2...5	Datalink A, B, C, or D Input
6...9	Datalink A, B, C, or D Output

3. If desired, set **Parameter 50 - [Peer B Output]** to select an additional source of the data to output to the network.

Figure 3.15 Example Peer B Output LCD HIM Screen



Value	Description
0	Off (Default)
1	Logic Command/Reference
2…5	Datalink A, B, C, or D Input
6…9	Datalink A, B, C, or D Output

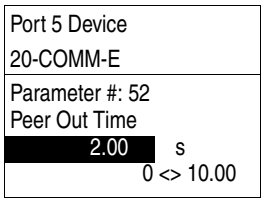
4. Set **Parameters 52 - [Peer Out Time]** and **53 - [Peer Out Skip]** to establish the minimum and maximum intervals between Peer messages. Because the adapter transmits Peer messages when a change-of-state condition occurs, minimum and maximum intervals are required.

   – The minimum interval ensures that the adapter does not transmit messages on the network too often, thus minimizing network traffic. It is set using **Parameter 52 - [Peer Out Time]**.

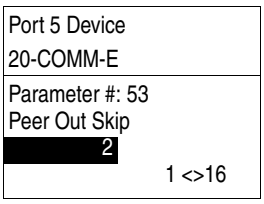
   – The maximum interval ensures that the adapter transmits messages often enough so that the receiving adapter(s) can receive recent data and verify that communications are working or, if communications are not working, can timeout. The maximum interval is the value of **Parameter 52 - [Peer Out Time]** multiplied by the value of **Parameter 53 - [Peer Out Skip]**.

   In the Figure 3.16 example, the minimum interval is set to 2.00 seconds (**Parameter 52 - [Peer Out Time]**), and the maximum interval is set to 4.00 seconds (2.00 x “2” setting of **Parameter 53 - [Peer Out Skip]**).

Figure 3.16 Example Peer Out Time and Peer Out Skip LCD HIM Screens



Default = 10.00 s



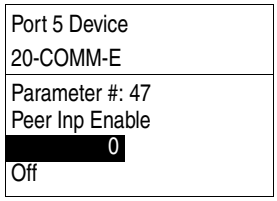
Default = 1

5. Set **Parameter 51 - [Peer Out Enable]** to “1” (On). The adapter will transmit the data selected in **Parameters 49 - [Peer A Output]** and **50 - [Peer B Output]** to the network. Another adapter must be configured to receive the Peer I/O data.

Setting the Adapter to Receive Peer-to-Peer Data

1. Verify that **Parameter 47 - [Peer Inp Enable]** is set to "0" (Off). This parameter must be Off while you configure the peer input parameters.

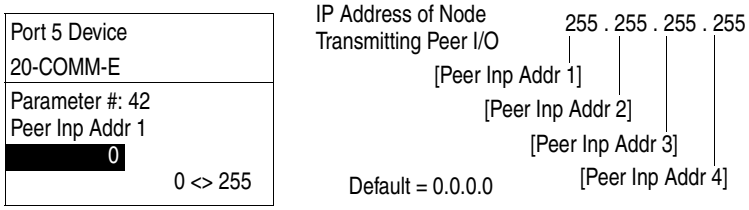
Figure 3.17 Example Peer Inp Enable LCD HIM Screen



Value	Setting
0	Off (Default)
1	On

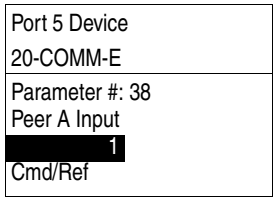
2. Set **Parameters 42 - [Peer Inp Addr 1]** through **45 - [Peer Inp Addr 4]** to the IP address of the node from which you want to receive data. Valid nodes must have 20-COMM-E adapters connected to drives with compatible Logic Command/Status words.

Figure 3.18 Example Peer Inp Addr 1 LCD HIM Screen



3. Set **Parameter 38 - [Peer A Input]** to select the destination of the data that is input to the drive as Peer A.

Figure 3.19 Example Peer A Input LCD HIM Screen



Value	Description
0	Off (Default)
1	Logic Command/Reference
2…5	Datalink A, B, C, or D Input

With the Series A adapter, if you select a Reference or Datalink as an input, note the following:

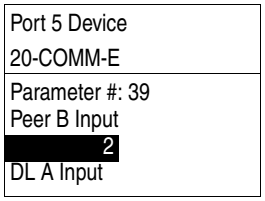
– If a drive that uses a 32-bit Reference and 32-bit Datalinks receives a 16-bit Reference or Datalink, it uses the data in its most significant word, and its least significant word is zero.

– If a drive that uses a 16-bit Reference and 16-bit Datalinks receives a 32-bit Reference or Datalink, it uses the data in the most significant word of the 32-bit Reference or Datalink and ignores the data in the least significant word.

With the Series B adapter, data is used from the least significant word in the event of a mismatch in Reference or Datalink sizes.

4. If desired, set **Parameter 39 - [Peer B Input]** to select the destination of the data to input to the drive as Peer B.

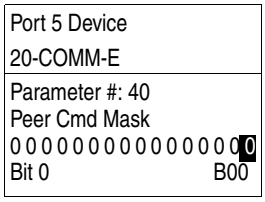
Figure 3.20 Example Peer B Input LCD HIM Screen



Value	Description
0	Off (Default)
1	Logic Command/Reference
2...5	Datalink A, B, C, or D Input

5. If the adapter receives a Logic Command, set the bits in **Parameter 40 - [Peer Cmd Mask]** that the drive should use. The bit definitions for the Logic Command word will depend on the drive to which the adapter is connected. Refer to Appendix D or drive documentation.

Figure 3.21 Example Peer Cmd Mask LCD HIM Screen



Value	Description
0	Ignore this command bit. (Default)
1	Use this command bit.

If the adapter receives a Logic Command from both a Master device and a Peer device, each command bit must have only one source. The source of command bits set to "0" will be the Master device. The source of command bits set to "1" will be the Peer device.

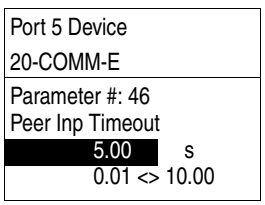
6. Reset the adapter (see Resetting the Adapter on page 3-17) so that changes to **Parameter 40 - [Peer Cmd Mask]** take effect.

7. Set **Parameter 46 - [Peer Inp Timeout]** to the maximum amount of time the adapter will wait for a message before timing out.

Important: This value must be greater than the product of **Parameter 52 - [Peer Out Time]** multiplied by **Parameter 53 - [Peer Out Skip]** in the adapter from which you are receiving I/O.

For example, if the value of **Parameter 52 - [Peer Out Time]** is 2.00 seconds and the value of **Parameter 53 - [Peer Out Skip]** is 2 (see Figure 3.16), then **Parameter 46 - [Peer Inp Timeout]** needs to have a value greater than 4.00, such as 5.00 (see Figure 3.22).

Figure 3.22 Example Peer Inp Timeout LCD HIM Screen

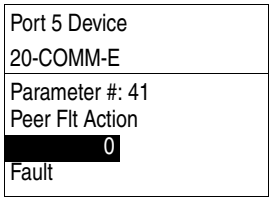


Default = 10.00 s

8. Set **Parameter 41 - [Peer Flt Action]** to the action that the adapter will take if it times out.

ATTENTION: Risk of injury or equipment damage exists. **Parameter 41 - [Peer Flt Action]** lets you determine the action of the adapter and connected drive if peer communications are disrupted. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a hazard of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable).

Figure 3.23 Example Peer Flt Action LCD HIM Screen



Value	Description
0	Fault (Default)
1	Stop
2	Zero Data
3	Hold Last
4	Send Flt Cfg

For more details, see Setting a Fault Action on page 3-15.

9. Set **Parameter 47 - [Peer Inp Enable]** to "1" (On).

The adapter is now configured to receive Peer I/O from the specified node. Ensure that the specified node is configured to transmit Peer I/O.

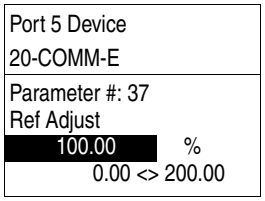
Setting the Reference Adjustment

A Reference Adjustment is a percent scaling factor for the Reference from the network. It can be set from 0.00 to 200.00% to allow the drive's Reference to either match the network Reference (= 100.00%), scale below the network Reference (< 100.00%), or scale above the network Reference (> 100.00%).

ATTENTION: To guard against equipment damage and/or personal injury, note that changes to adapter **Parameter 37 - [Ref Adjust]** take effect immediately. A drive receiving its Reference from the adapter will receive the newly scaled Reference, resulting in a change of speed.

If the adapter is receiving a Reference, set **Parameter 37 - [Ref Adjust]** to the desired scaling factor.

Figure 3.24 Example Ref Adjust LCD HIM Screen



Default = 100.00%

The adjustment takes effect as soon as it is entered.

Setting a Fault Action

By default, when I/O communications are disrupted (for example, a cable is disconnected) or the controller is idle (in program mode or faulted), the drive responds by faulting if it is using I/O from the network. You can configure a different response to:

- Disrupted I/O communication using **Parameter 21 - [Comm Flt Action]**
- An idle controller using **Parameter 22 - [Idle Flt Action]**

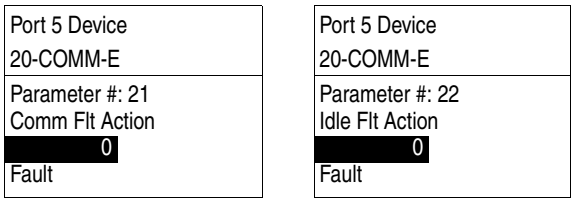
ATTENTION: Risk of injury or equipment damage exists. **Parameters 21 - [Comm Flt Action]** and **22 - [Idle Flt Action]** let you determine the action of the adapter and connected drive if I/O communications are disrupted or the controller is idle. By default, these parameters fault the drive. You can set these parameters so that the drive continues to run. Precautions should be taken to ensure that the settings of these parameters do not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable or faulted controller).

Changing the Fault Action

Set the values of **Parameters 21 - [Comm Flt Action]** and **22 - [Idle Flt Action]** to the desired responses:

Value	Action	Description
0	Fault	The drive is faulted and stopped. (Default)
1	Stop	The drive is stopped, but not faulted.
2	Zero Data	The drive is sent 0 for output data. This does not command a stop.
3	Hold Last	The drive continues in its present state.
4	Send Flt Cfg	The drive is sent the data that you set in the fault configuration parameters (**Parameters 25 - [Flt Cfg Logic]** through **34 - [Flt Cfg D2 In]**).

Figure 3.25 Example Fault Action LCD HIM Screens



Changes to these parameters take effect immediately. A reset is not required.

If communication is disrupted and then is re-established, the drive will automatically take commands from the network again.

Setting the Fault Configuration Parameters

If you set **Parameter 21 - [Comm Flt Action]** or **22 - [Idle Flt Action]** to "Send Flt Cfg," the values in the following parameters are sent to the drive after an I/O communications fault and/or idle fault occurs. You must set these parameters to values required by your application.

Parameter	Description
25 - [Flt Cfg Logic]	A 16-bit value sent to the drive for Logic Command.
26 - [Flt Cfg Ref]	A 32-bit value (0…4294967295) sent to the drive as a Reference or Datalink.
27 - [Flt Cfg x1 In] through **34 - [Flt Cfg x2 In]**	**Important:** If the drive uses a 16-bit Reference or 16-bit Datalinks, the most significant word of the value must be set to zero (0) or a fault will occur.

Changes to these parameters take effect immediately. A reset is not required.

Setting Web Access Control

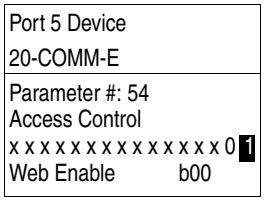
By using a web browser to access the IP address set for the adapter, you can view the adapter's web pages for information about the adapter, its connected drive, and other DPI devices connected to the drive, such as HIMs or converters. Additionally, the adapter can be configured to automatically send e-mail messages to desired addresses when selected drive faults occur and/or are cleared, and/or when the adapter takes a communication or idle fault action. For more details on the adapter's web pages, refer to Chapter 8, Viewing the Adapter's Web Pages.

TIP: Series A adapter web pages are accessed differently than Series B web pages. Enabling/disabling e-mail configuration is also different.

Series A Adapter (firmware version 2.002 or earlier)

By default, the Series A adapter web pages are enabled. To disable the adapter web pages, use **Parameter 54 - [Access Control]** to set the Web Enable Bit 0 value to "0" (Disabled). To protect the configured settings for adapter e-mail messaging, use **Parameter 54 - [Access Control]** to set the E-mail Config Bit 1 value to "0" (Disabled). E-mail messaging will remain active regardless of whether or not its settings are protected — unless e-mail messaging was *never* configured. For more information about configuring adapter e-mail messaging, see Configure E-mail Notification Web Page on page 8-6).

Figure 3.26 Example Web Access Control LCD HIM Screen



Bit	Description
0	Web Enable (Default = 1 = Enabled)
1	E-mail Config (Default = 0 = Disabled)
2…31	Not Used

Bit 0 is the right-most bit. In Figure 3.26 it is highlighted and equals "1."

Changes to this parameter take effect immediately. A reset is not required.

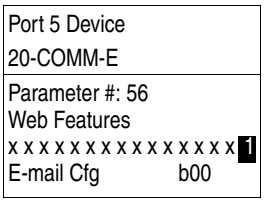
Series B Adapter (firmware version 3.xxx or later)

By default, the Series B adapter web pages are disabled. See Figure 2.1 and set the Web Pages Switch (SW2) to the "Enable Web" (up) position.

Important: For a change to the switch setting to take effect, the adapter must be reset (see Resetting the Adapter on page 3-17).

Bit 0 of **Parameter 56 - [Web Features]** is used to protect the configured settings for e-mail messaging. By default, settings are not protected and the user can make changes. To protect the configured settings, set the value of E-mail Cfg Bit 0 to "0" (Disabled). You can unprotect the configuration by changing Bit 0 back to "1" (Enabled). E-mail messaging will always remain active regardless of whether or not its settings are protected — unless e-mail messaging was *never* configured. For more information about configuring adapter e-mail messaging or to stop e-mail messages, see Configure E-mail Notification Web Page on page 8-6.

Figure 3.27 Example Web Features LCD HIM Screen



Bit	Description
0	E-mail Cfg (Default = 1 = Enabled)
1…7	Not Used

Bit 0 is the right-most bit. In Figure 3.27 it is highlighted and equals "1."

Changes to this parameter take effect immediately. A reset is not required.

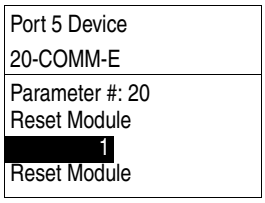
Resetting the Adapter

Changes to switch settings and some adapter parameters require that you reset the adapter before the new settings take effect. You can reset the adapter by power cycling the drive or by using **Parameter 20 - [Reset Module]**.

ATTENTION: Risk of injury or equipment damage exists. If the adapter is transmitting control I/O to the drive, the drive may fault when you reset the adapter. Determine how your drive will respond before resetting a connected adapter.

Set **Parameter 20 - [Reset Module]** to "1" (Reset Module).

Figure 3.28 Example Reset Module LCD HIM Screen



Value	Description
0	Ready (Default)
1	Reset Module
2	Set Defaults

When you enter "1" (Reset Module), the adapter will be immediately reset. When you enter "2" (Set Defaults), the adapter will set all adapter

parameters to their factory-default values. After performing a Set Defaults, enter “1” (Reset Module) so that the new values take effect. The value of this parameter will be restored to “0” (Ready) after the adapter is reset.

Viewing the Adapter Status Using Parameters

The following parameters provide information about the status of the adapter. You can view these parameters at any time.

Parameter	Description
17 - [EN Rate Act]	The data rate used by the adapter.
18 - [Ref/Fdbk Size]	The size of the Reference/Feedback. It will either be 16 bits or 32 bits. It is set in the drive and the adapter automatically uses the correct size.
19 - [Datalink Size]	The size of the Datalinks. It will either be 16 bits or 32 bits. It is set in the drive and the adapter automatically uses the correct size.
24 - [DPI I/O Act]	The Reference/Feedback and Datalinks used by the adapter. This value is the same as **Parameter 23 - [DPI I/O Cfg]** unless the parameter was changed and the adapter was not reset. Bit Definition: Not Used, Not Used, Not Used, Datalink D, Datalink C, Datalink B, Datalink A, Cmd/Ref Default: x, x, x, 0, 0, 0, 0, 1 Bit: 7, 6, 5, 4, 3, 2, 1, 0 0 = I/O disabled 1 = I/O enabled
48 - [Peer Inp Status]	The status of the consumed peer input connection: Values 0 = Off 1 = Waiting 2 = Running 3 = Faulted

Flash Updating the Adapter

The adapter can be flash updated over the network or serially through a direct connection from a computer to the drive using a 1203-USB or 1203-SSS serial converter.

When flashing over the network, you can use the Allen-Bradley software tool ControlFLASH, the built-in flash capability of DriveExplorer Lite or Full, or the built-in flash capability of DriveExecutive.

When flashing through a direct serial connection from a computer to a drive, you can use the same Allen-Bradley software tools described above, or you can use HyperTerminal set to the X-modem protocol.

To obtain a flash update for this adapter, go to http://www.ab.com/support/abdrives/webupdate. This site contains all firmware update files and associated Release Notes that describe firmware update enhancements/anomalies, how to determine the existing firmware version, and how to flash update using DriveExplorer, DriveExecutive, ControlFLASH or HyperTerminal.

Configuring the I/O

This chapter provides instructions on how to configure a Rockwell Automation ControlLogix, PLC-5, SLC 500 or MicroLogix 1100/1400 controller to communicate with the adapter and connected PowerFlex drive.

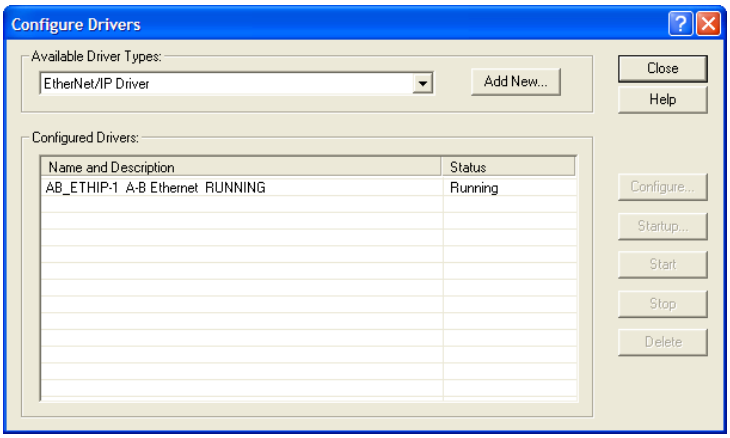
Topic	Page
Using RSLinx Classic	4-1
ControlLogix Example	4-2
Limitations When Using PLC-5, SLC 500 or MicroLogix 1100/1400	4-21
PLC-5 Example	4-22
SLC 500 Example	4-30
MicroLogix 1100/1400 Example	4-38

Using RSLinx Classic

RSLinx Classic, in all its variations (Lite, Gateway, OEM, etc.), is used to provide a communication link between the computer, network, and controller. RSLinx Classic requires its network-specific driver to be configured before communications are established with network devices. To configure the RSLinx driver:

1. Start RSLinx and select **Communications > Configure Drivers** to display the Configure Drivers screen.
2. From the Available Driver Types pull-down box, choose "EtherNet/IP Driver" and then click **Add New…** to display the Add New RSLinx Driver screen.
3. Use the default name or type a new name and click **OK**. The "Configure driver:" screen appears.
4. Depending on your application, select either the browse local or remote subnet option, and click **OK**. The Configure Drivers screen reappears with the new driver in the Configured Drivers list (Figure 4.1).

Figure 4.1 Configure Drivers Screen with a Configured Driver



5. Click **Close** to close the Configure Drivers screen. Keep RSLinx running.

6. Verify that your computer recognizes the drive. Select **Communications > RSWho** and, in the menu tree, click the "+" symbol next to the Ethernet driver.

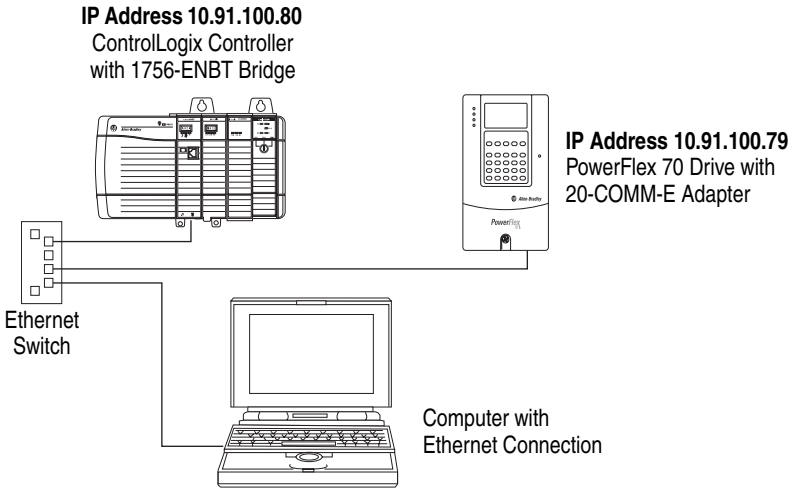
   Note that two other RSLinx drivers (Ethernet devices or Remote Devices via Linx Gateway) may be used. Use one of these drivers if the "EtherNet/IP driver" cannot see your drive.

ControlLogix Example

Example Network

After the adapter is configured, the connected drive and adapter will be a single node on the network. This section provides the steps needed to configure a simple EtherNet/IP network (see Figure 4.2). In our example, we will configure a ControlLogix controller with 1756-ENBT (Series A) bridge to communicate with a drive using Logic Command/Status, Reference/Feedback, and 16 Datalinks (8 to read and 8 to write) over the network.

Figure 4.2 Example ControlLogix EtherNet/IP Network



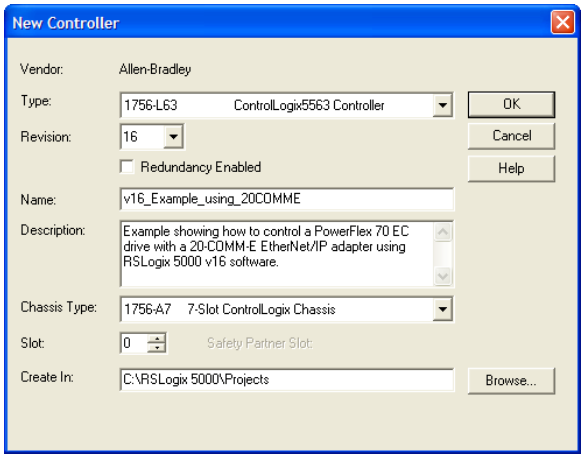
NOTE: Information for PowerFlex 750-Series drives has been added to this manual where applicable.

Adding the Bridge to the I/O Configuration

To establish communications between the controller and adapter over the network, you must first add the ControlLogix controller and its bridge to the I/O configuration. This procedure is similar for all RSLogix 5000 versions.

1. Start RSLogix 5000. The RSLogix 5000 window appears. Select **File > New** to display the New Controller screen (Figure 4.3).

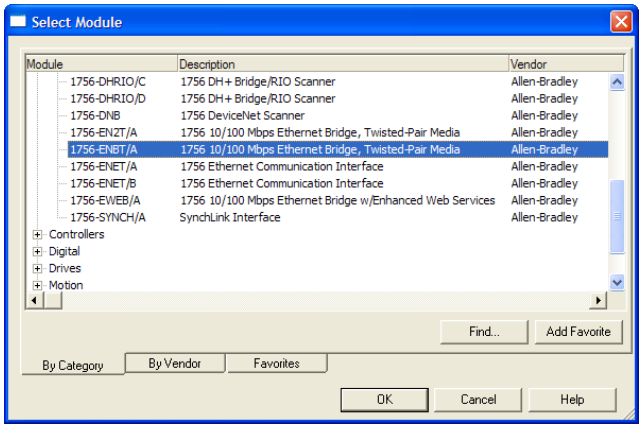
Figure 4.3 New Controller Screen (RSLogix 5000 v16 shown)



Select the appropriate choices for the fields in the screen to match your application. Then click **OK**. The RSLogix 5000 window reappears with the treeview in the left pane.

2. In the treeview, right-click the I/O Configuration folder and select **New Module…** The Select Module screen appears. Expand the Communications group to display all of the available communication modules (Figure 4.4).

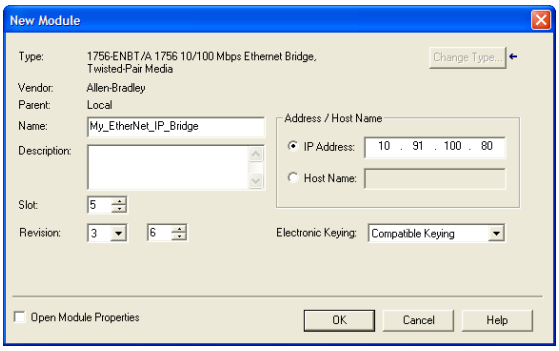
Figure 4.4 Bridge Select Module Screen



3. In the list, select the EtherNet/IP bridge used by your controller. In this example, we use a 1756-ENBT EtherNet/IP Bridge (Series A), so the 1756-ENBT/A option is selected. Then click **OK**. In the Select Major Revision pop-up dialog box, select the major revision of its firmware.

4. Click **OK**. The bridge's New Module screen (Figure 4.5) appears.

Figure 4.5 Bridge New Module Screen

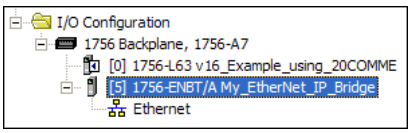


5. Edit the following:

Box	Setting
Name	A name to identify the EtherNet/IP bridge.
Description	Optional – description of the EtherNet/IP bridge.
IP Address	The IP address of the EtherNet/IP bridge.
Host Name	Not used.
Slot	The slot of the EtherNet/IP bridge in the rack.
Revision	The minor revision of the firmware in the bridge. (You already set the major revision by selecting the bridge series in Step 3.)
Electronic Keying	**Compatible Keying**. The "Compatible Keying" setting for Electronic Keying ensures the physical module is consistent with the software configuration before the controller and bridge make a connection. Therefore, ensure that you have set the correct revision in this screen. Refer to the online Help for additional information on this and other Electronic Keying settings. If keying is not required, select "Disable Keying." Disable keying is recommended.
Open Module Properties	When this box is checked, additional module properties screens will appear to further configure the bridge after clicking **OK**. When unchecked, the bridge's New Module screen will close after clicking **OK**. For this example, uncheck this box.

6. Click **OK**. The bridge is now configured for the EtherNet/IP network and added to the RSLogix 5000 project. It appears in the I/O Configuration folder. In our example, a 1756-ENBT bridge appears under the I/O Configuration folder (Figure 4.6) with its assigned name. For convenience, keep the project open. Later in this chapter the project will need to be downloaded to the controller.

Figure 4.6 RSLogix 5000: I/O Configuration Folder



There are three ways to add the adapter into the I/O configuration:

- Drive Add-On Profiles (RSLogix 5000 version 16 or later)
- Classic Profile (RSLogix 5000 versions 13…15)
- Generic Profile (RSLogix 5000 all versions)

These are described in separate sections below. If your version of RSLogix 5000 supports Add-On Profiles, we highly recommend using this method.

Using RSLogix 5000 Drive Add-On Profiles (version 16 or later)

When compared to using the RSLogix 5000 Classic Profile (versions 13…15) or Generic Profile (all versions), the RSLogix 5000 Drive Add-On Profiles provide these advantages:

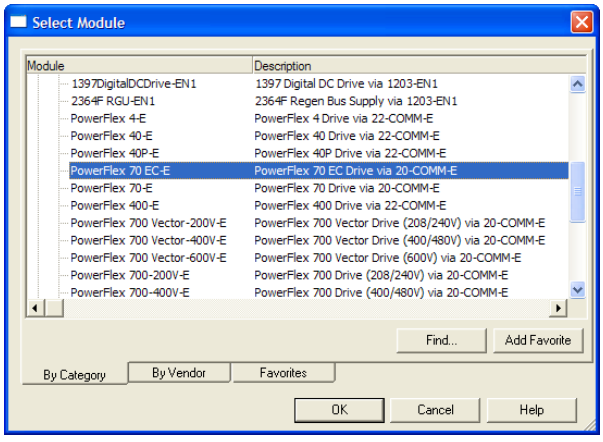
- Profiles for specific drives that provide descriptive controller tags for basic control I/O words (Logic Command/Status and Reference/Feedback) and Datalinks. Additionally, Datalinks automatically take the name of the drive parameter to which they are assigned. These profiles virtually eliminate I/O mismatch errors and substantially reduce drive configuration time.
- New Drive tab eliminates the need for a separate drive software configuration tool.
- Drive configuration settings are saved as part of the RSLogix 5000 (v16 or later) project file (.ACD) and also downloaded to the controller.
- Unicast connection (version 18 or later)
- Drive Add-On Profiles can be updated anytime. When a new drive is used or to benefit from new updates for Add-On Profiles, you will need the newest Add-On Profile update. Go to www.ab.com/support/abdrives/webupdate to download the latest RSLogix 5000 drive Add-On Profile. To determine your drive Add-On Profile version, refer to Allen-Bradley Knowledgebase document #65882.

Adding the Drive/Adapter to the I/O Configuration

To transmit data between the bridge and the drive, you must add the drive as a child device to the parent bridge. In this example, RSLogix 5000 version 16 is used with drive Add-On Profile version 3.01.

1. In the treeview, right-click on the bridge and select **New Module…** to display the Select Module screen. In our example, we right-click on the 1756-ENBT/A bridge. Expand the Drives group to display all of the available drives with their communication adapters.

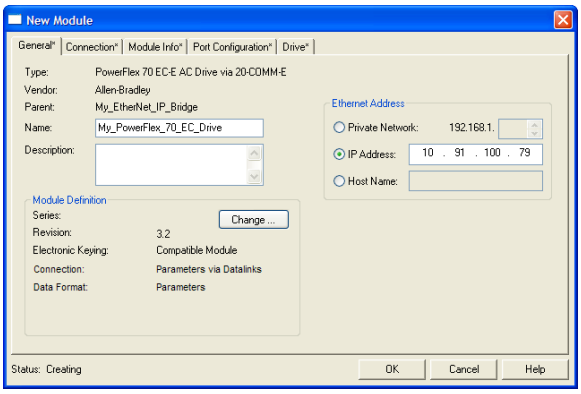
Figure 4.7 Drive Select Module Screen



TIP: If the PowerFlex drive is not shown, go to www.ab.com/support/abdrives/webupdate and download the latest RSLogix 5000 drive Add-On Profile.

2. From the list (Figure 4.7), select the drive and its connected adapter. For this example, we selected "PowerFlex 70 EC-E." Then click **OK**. The drive's New Module screen (Figure 4.8) appears.

Figure 4.8 Drive New Module Screen



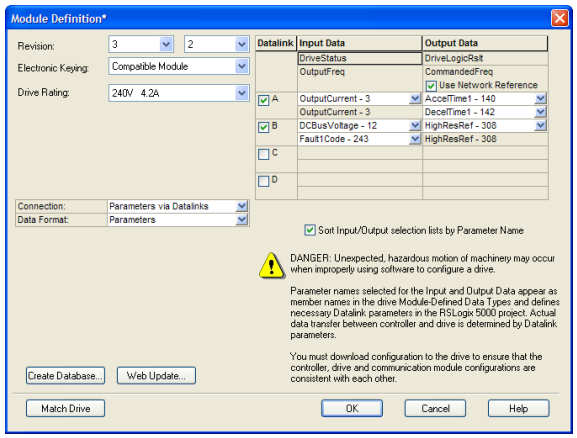
3. On the General tab, edit the following data about the drive/adapter:

Box	Setting
Name	A name to identify the drive.
Description	Optional – description of the drive/adapter.
IP Address	The IP address of the adapter.

4. On the New Module screen in the Module Definition section, click **Change…** to launch the Module Definition screen (Figure 4.9) and begin the drive/adapter configuration process. In this example, Datalinks are used to do the following:

Read...	Write to...
Output Current (Parameter 3)	Accel Time 1 (Parameter 140)
DC Bus Voltage (Parameter 12)	Decel Time 1 (Parameter 142)
Fault 1 Code (Parameter 243)	High Resolution Reference (Parameter 308)

Figure 4.9 Module Definition Screen



TIP: To get the latest RSLogix 5000 drive Add-On Profile, go to www.ab.com/support/abdrives/webupdate.

5. In the Module Definition screen, edit the following information:

Box	Setting
Revision	The major and minor revision of the firmware (database) in the drive. If the drive's major and minor revision is not available, the drive database is not installed on your computer. To get the correct database revision, use one of the following buttons at the bottom left of the Module Definition screen: • **Create Database...** Creates a database from an online network drive. Clicking this button displays an RSLinx RSWho window. Browse to the online drive (for this example, PowerFlex 70 EC), select it, and click **OK**. The database will be uploaded and stored on the computer. Thereafter, close the Module Definition screen and then re-open it to display the new revision. • **Web Update...** When a drive is not available online, opens the Allen-Bradley Drives Web Updates web site to download a specific database file. After downloading the file, close the Module Definition screen and then re-open it to display the new revision. • **Match Drive:** Use this button when the drive being added to the network matches the drive profile (revision, rating, configuration settings, etc.) of an existing online network drive. Click this button to conveniently create a duplicate drive profile from the online drive, and automatically load this identical information into the Module Definition screen. This eliminates the need to manually enter the information each time a new drive with a matching profile is added to the network.
Electronic Keying	**Compatible Module**. The "Compatible Module" setting for Electronic Keying ensures the physical module is consistent with the software configuration before the controller and bridge make a connection. Therefore, ensure that you have set the correct revision in this screen. Refer to the online Help for additional information on this and other Electronic Keying settings. If keying is not required, select "Disable Keying." Drives do not require keying, and so "Disable Keying" is recommended.
Drive Rating	The voltage and current rating of the drive. If the drive rating is not listed, the drive database is not installed on your computer. To get the correct drive rating, use the **Create Database...**, **Web Update...**, or **Match Drive** button described above.
Connection	**Parameters via Datalinks.** When selecting "Parameters via Datalinks" (default), the controller tags for the Datalinks use the drive parameter names to which they are assigned. When selecting "Datalinks," the controller tags for the Datalinks have non-descriptive UserDefinedData[n] names like those used in RSLogix 5000 version 15.
Data Format	**Parameters.** When the Connection field is set to "Parameters via Datalinks," "Parameters" is automatically selected. When the Connection field is set to "Datalinks," you must select the number of Datalinks required for your application in the "Data Format" field.
Datalink A, B, C, D	In the Input Data column, assigns selected drive parameters to be READ by the controller. In the Output Data column, assigns selected drive parameters to be WRITTEN by the controller.
Sort Input/ Output selection...	When this box is checked, sorts the Input Data and Output Data assigned parameters by name and then by number, and enables parameter search by name. When unchecked, sorts the assigned parameters by parameter number and then by name, and enables parameter search by number.
Use Network Reference	Conveniently selects the speed reference for the drive to come from the network. This box is checked by default.

When a 32-bit parameter is selected for Input Data or Output Data for a drive with 16-bit Datalinks, two contiguous Datalinks (for example, x1 and x2, where x = A, B, C or D) are automatically assigned as a pair to represent that parameter. See Datalink examples in Figure 4.9. For more information on Datalinks, see Using Datalinks on page 5-7.

On the Module Definition screen, notice that the automatically-assigned controller tags DriveStatus, OutputFreq, DriveLogicRslt, and CommandedFreq are always used.

When a Datalink is enabled, the following 20-COMM-E adapter I/O parameters are automatically set:

– **Parameter 23 - [DPI I/O Cfg]** turns on the enabled Datalink bit so the 20-COMM-E adapter will communicate that Datalink's information with the drive.

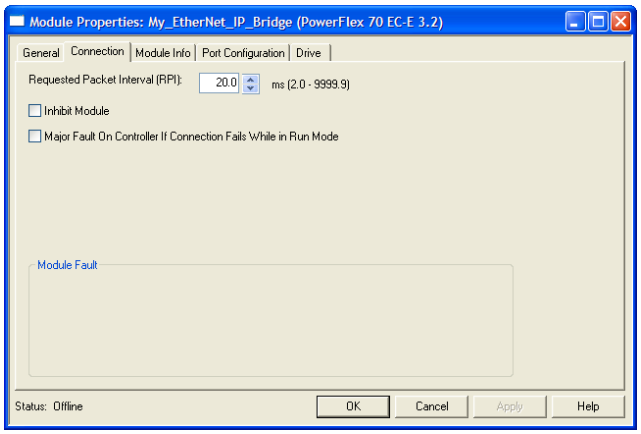
– **Parameter 35 - [M-S Input]** turns on the enabled Datalink bit so the 20-COMM-E adapter will input that Datalink's information from the controller.

– **Parameter 36 - [M-S Output]** turns on the enabled Datalink bit so the 20-COMM-E adapter will output that Datalink's information to the controller.

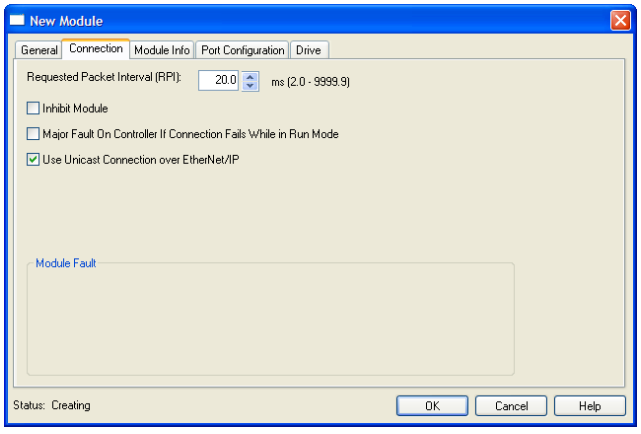
6. Click **OK** on the Module Definition screen to save the drive and adapter configuration and close the screen. The drive's New Module screen reappears.

7. On the New Module screen, click the Connection tab (Figure 4.10).

Figure 4.10 New Module Connection Tab Screen



Screen for RSLogix 5000 versions 16 and 17



Screen for RSLogix 5000 version 18 (or later)

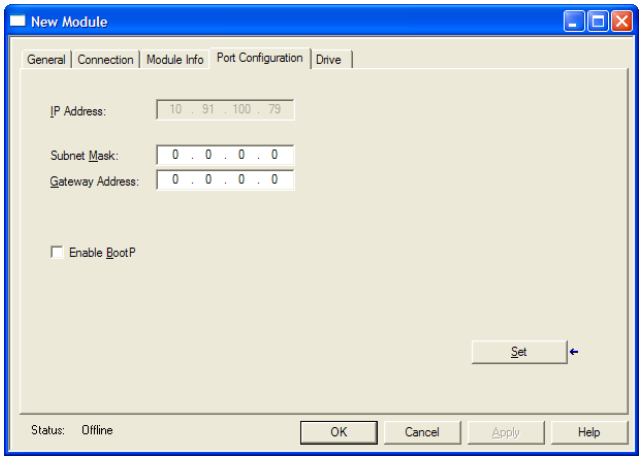
8. In the “Requested Packet Interval (RPI)” box, set the value to 5.0 milliseconds or greater. This value determines the maximum interval that a controller should use to move data to and from the adapter. To conserve bandwidth, use higher values for communicating with low priority devices.

   The “Inhibit Module” box, when checked, inhibits the module from communicating with the RSLogix 5000 project. When the “Major Fault on …” box is checked, a major controller fault will occur when the module’s connection fails while the controller is in the Run Mode. For this example, leave the “Inhibit Module” and “Major Fault On …” boxes unchecked.

   Unicast support has been added to RSLogix 5000 version 18. However, to also support unicast, the controller firmware must be version 18 (or later) and the 20-COMM-E Series B adapter at version 4.001 (or later). Unicast is recommended whenever possible. For the benefits of unicast operation, see Preparing for an Installation on page 2-1. If unicast is selected and the 20-COMM-E adapter does not support it, the connection will be rejected. In this case, either update the 20-COMM-E firmware to version 4.001 (or later) or uncheck the “Use Unicast Connection over EtherNet/IP” checkbox (Figure 4.10).

9. On the New Module screen, click the Port Configuration tab (Figure 4.11).

Figure 4.11 New Module Port Configuration Tab Screen



10. In the Port Configuration tab screen, edit the following information:

Box	Setting
IP Address	The IP address of the adapter that was already set in the General tab. This field is not configurable (grayed out).
Subnet Mask	The Subnet Mask configuration setting of the network. This setting must match the setting of other devices on the network (for example, 255.255.255.0).
Gateway Address	The Gateway Address configuration setting of the network. This setting must match the setting of other devices on the network (for example, 10.91.100.1).
Enable BootP	When this box is checked, BOOTP is enabled in the adapter and will ignore the IP address set in the General tab. When unchecked, the controller uses the set IP address. This is another method to enable/disable BOOTP in the adapter. For this example, leave this box unchecked.

11. Click **Set** to save the Port Configuration information which sets the corresponding offline Subnet Cfg x and Gateway Cfg x parameters in the adapter.

12. Click **OK** on the New Module screen. The new node (for this example, “My_PowerFlex_70_EC_Drive”) now appears under the bridge (for this example, “My_EtherNet_IP_Bridge”) in the I/O Configuration folder. If you double-click on the Controller Tags, you will see that module-defined data types and tags have been automatically created (Figure 4.12). Note that all tag names are defined and Datalinks include the assigned drive parameter name. After you save and download the configuration, these tags allow you to access the Input and Output data of the drive via the controller’s ladder logic.

Figure 4.12 Controller Tags

Name	Value	Force Mask	Style	Data Type
My_PowerFlex_70_EC_Drive:I	{...}	{...}		AB:PowerFlex70E...
My_PowerFlex_70_EC_Drive:I.DriveStatus	2#0000...		Binary	INT

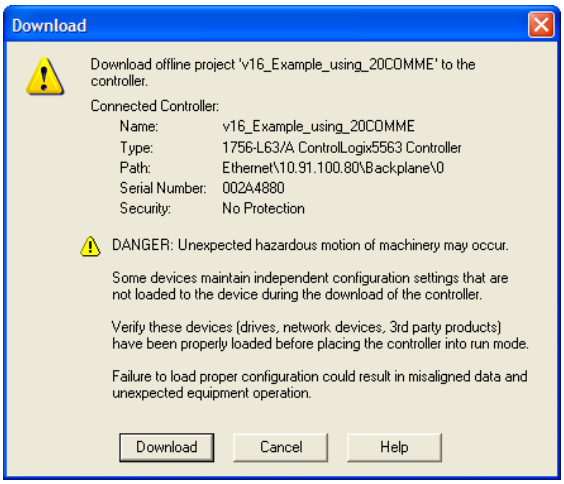
My_PowerFlex_70_EC_Drive:O.DriveLogicRslt_SpdRefID0	0		Decimal	BOOL
My_PowerFlex_70_EC_Drive:O.DriveLogicRslt_SpdRefID1	0		Decimal	BOOL

Saving the I/O Configuration to the Controller

After adding the bridge and drive/adapter to the I/O configuration, you must download the configuration to the controller. You should also save the configuration to a file on your computer.

1. In the RSLogix 5000 window, select **Communications > Download**. The Download dialog box (Figure 4.13) appears.

Figure 4.13 Download Dialog Box



TIP: If a message box reports that RSLogix 5000 is unable to go online, select **Communications > Who Active** to find your controller in the Who Active screen. After finding and selecting the controller, click **Set Project Path** to establish the path. If your controller does not appear, you need to add or configure the EtherNet/IP driver in RSLinx. Refer to the RSLinx online help.

2. Click **Download** to download the configuration to the controller. When the download is successfully completed, RSLogix 5000 goes into the Online mode and the I/O Not Responding box in the upper-left of the window should be flashing green. Also, a yellow warning symbol should be displayed on the I/O Configuration folder in the treeview and on the drive profile.

   If the controller was in Run Mode before clicking **Download**, RSLogix 5000 prompts you to change the controller mode back to Remote Run. In this case, choose the appropriate mode for your application. If the controller was in Program Mode before clicking **Download**, this prompt will not appear.

3. Select **File > Save**. If this is the first time you saved the project, the Save As dialog box appears. Navigate to a folder, type a file name, and click **Save** to save the configuration to a file on your computer.

   To ensure that the present project configuration values are saved, RSLogix 5000 prompts you to upload them. Click **Yes** to upload/save.

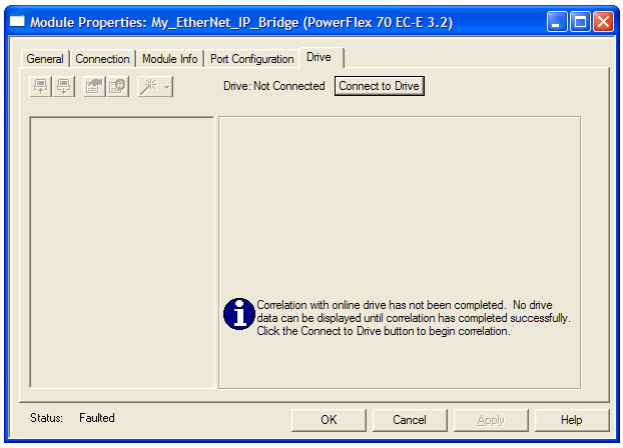
Correlating the Drive with the Controller

You must now correlate the drive settings to the RSLogix 5000 project I/O settings so that they match. This requires loading the project I/O settings into the drive.

1. In the treeview under I/O Configuration, right-click on the drive profile (for this example My_PowerFlex_70_EC_Drive) and select **Properties**.

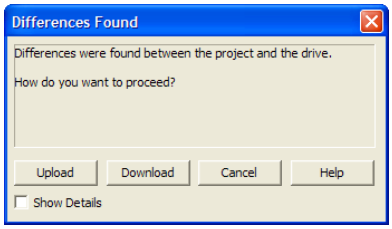
2. Click the Drive tab and then click **Connect to Drive** (Figure 4.14) to begin the correlation process.

Figure 4.14 Drive Correlation Screen



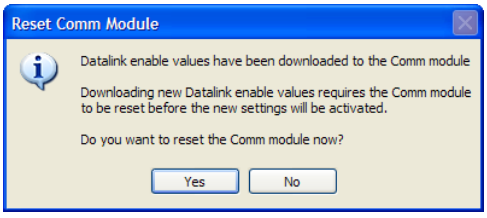
If the Differences Found screen (Figure 4.15) appears—which is typical, click **Download**. This will download the project settings from the controller to the drive and its connected adapter. If **Upload** is clicked, the drive and adapter settings are uploaded to the controller.

Figure 4.15 Differences Found Screen



3. When the Reset Comm Module screen (Figure 4.16) appears, click **Yes** to reset the communication adapter so that the new I/O settings take effect.

Figure 4.16 Reset Comm Module Screen

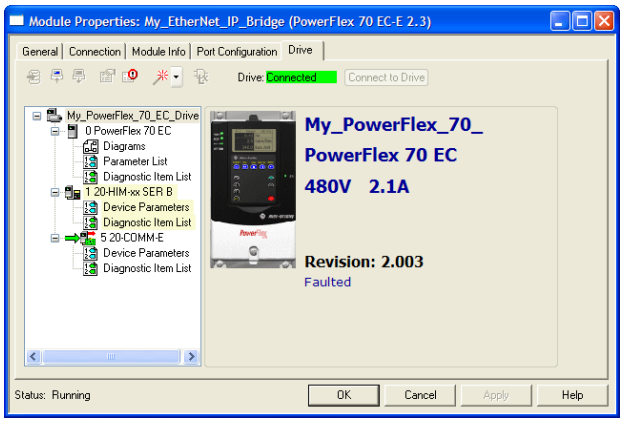


After resetting the communication module, which may take up to a minute to complete, the I/O OK box in the upper-left of the RSLogix 5000 window should now be steady green and the yellow warning symbols ⚠ in the treeview under the I/O Configuration folder and drive profile should be gone.

TIP: If the yellow warning symbol ⚠ for your drive remains displayed, first try power cycling the drive. Otherwise, double-click the drive under the I/O tree and click the Connection tab to find the cause of the problem.

4. The Module Properties Drive Tab screen (Figure 4.17) re-appears. You can view the drive's Parameter List, Diagnostic Items List, and lists for any connected peripheral, including the 20-COMM-E. While connected to the drive, you can dynamically change values of parameters. Diagnostic items and diagram views can be used for troubleshooting. Table 7.A on page 7-4 provides diagnostic items for troubleshooting the adapter.

Figure 4.17 Module Properties Drive Tab Screen



5. When finished, click **OK** to close the Module Properties screen for the drive.

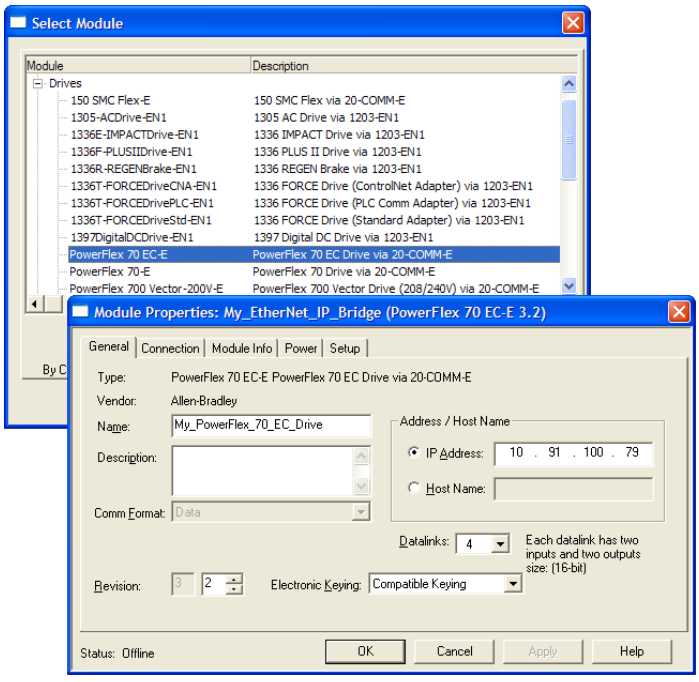
Using the RSLogix 5000 Classic Profile (versions 13...15)

When compared to using the RSLogix 5000 Generic Profile (all versions), the RSLogix 5000 Classic Profile provides these advantages:

- Profiles for specific drives (Figure 4.18) that provide descriptive controller tags for basic control I/O words (Logic Command/Status and Reference/Feedback). The controller tags for Datalinks, however, have non-descriptive UserDefinedData[n] names.
- Improved I/O configuration—no I/O assembly configuration required. Basic control I/O is defined, but Datalinks still need to be configured/mapped.
- The Setup tab includes a DriveExecutive icon link to conveniently launch DriveExecutive (when installed on computer) to match the adapter I/O configuration with the controller, and to assign the Datalink parameters in the drive. This reduces I/O mismatches.

TIP: Since the RSLogix 5000 Classic Profile has been significantly improved upon by RSLogix 5000 Drive Add-On Profiles (version 16 or later), it is highly recommended to use RSLogix 5000 Drive Add-On Profiles to take advantage of its benefits (more intuitive, time saving, and less likely to make I/O configuration errors).

Figure 4.18 Classic Profile Screens for Drives



When Datalinks are used, you must enable the desired Datalinks and assign names to their non-descriptive controller tags. When a Datalink is enabled, you must set the following adapter I/O parameters:

- **Parameter 23 - [DPI I/O Cfg]** turns on the enabled Datalink bit so the 20-COMM-E adapter will communicate that Datalink's information with the drive.
- **Parameter 35 - [M-S Input]** turns on the enabled Datalink bit so the 20-COMM-E adapter will input that Datalink's information from the controller.
- **Parameter 36 - [M-S Output]** turns on the enabled Datalink bit so the 20-COMM-E adapter will output that Datalink's information to the controller.

When using Datalinks, up to 8 drive [Data In xx] parameters (300…307) and/or up to 8 [Data Out xx] parameters (310…317) must be assigned to point to the appropriate drive parameters for your application.

Using the RSLogix 5000 Generic Profile (all versions)

The basic RSLogix 5000 Generic Profile is only recommended when:

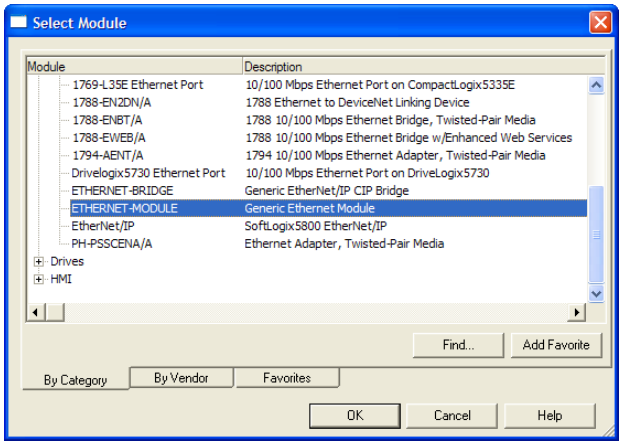
- A specific drive profile in other versions of RSLogix 5000 is unavailable.
- Users are already familiar with a drive Generic Profile and do not want to convert an existing project to a Classic Profile (versions 13…15) or a drive Add-On Profile (version 16 or later).
- A project must maintain specific revision level control.
- The controller cannot be taken offline. RSlogix 5000 version 16 (or later) enables the drive Generic Profile to be added while the controller is online and in the Run mode.

Adding the Drive/Adapter to the I/O Configuration

To transmit data between the bridge and the drive, you must add the drive as a child device to the parent bridge.

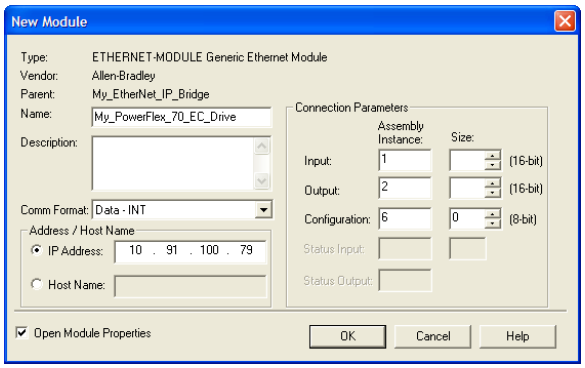
1. In the treeview, right-click on the bridge and select **New Module…** to display the Select Module screen (Figure 4.19). In our example, we right-click on the 1756-ENBT/A bridge. Expand the Communications group to display all of the available communication modules.

Figure 4.19 Select Module Screen



2. Select “ETHERNET-MODULE” from the list (Figure 4.19) to configure the drive and its connected 20-COMM-E adapter, and then click **OK**. The drive’s New Module screen (Figure 4.20) appears.

Figure 4.20 Drive New Module Screen



3. Edit the following information about the drive/adapter:

Box	Setting
Name	A name to identify the drive and adapter.
Description	Optional – description of the drive/adapter.
Comm Format	**Data - INT** (This setting formats the data in 16-bit words.)
IP Address	The IP address of the adapter.
Open Module Properties	When this box is checked, the drive’s New Module screen will close when clicking **OK**. When unchecked, additional module properties screens will appear to further configure the drive/adapter when **OK** is clicked. For this example, check this box.

4. Under Connection Parameters, edit the following:

Box	Assembly Instance	Size
Input	**1** (This value is required.)	The value will vary based on your application (setting of **Parameters 23 - [DPI I/O Cfg]** and **36 - [M-S Output]**) and the size (16-bit or 32-bit) of the Reference/Feedback and Datalinks in the drive. Refer to Table 4.A, Table 4.B or Table 4.C on page 4-17.
Output	**2** (This value is required.)	The value will vary based on your application (setting of **Parameters 23 - [DPI I/O Cfg]** and **35 - [M-S Input]**) and the size (16-bit or 32-bit) of the Reference/Feedback and Datalinks in the drive. Refer to Table 4.A, Table 4.B or Table 4.C on page 4-17.
Configuration	**6** (This value is required.)	**0** (This value is required.)

The following tables define the number of 16-bit words that you need to enter for the Input Size and Output Size boxes depending on your configuration.

Table 4.A PowerFlex 70/700/700H and SMC Flex (16-bit Reference/Feedback and 16-bit Datalinks)

Logic Command/ Status	Ref/Fdbk (16-bit)	Datalinks (16-bit)				User Configured Settings				
						Size in Words		Par. 23 - [DPI I/O Cfg]	Par. 35 - [M-S Input]	Par. 36 - [M-S Output]

✔	✔	✔	✔	✔	✔	22	20	...1 1111	...1 1111	...1 1111

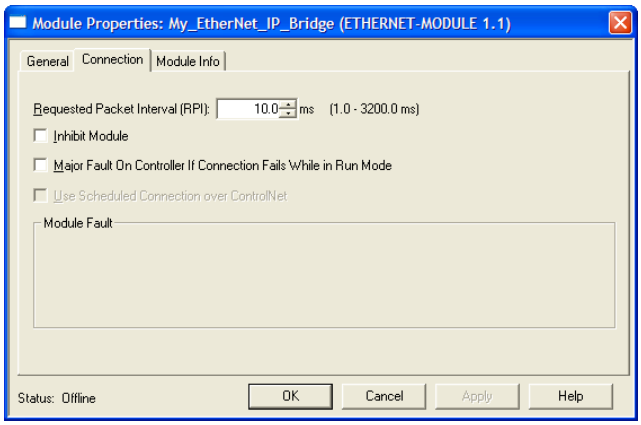
TIP: For instructions on configuring the I/O for the adapter using **Parameter 23 - [DPI I/O Cfg]** and its Master-Slave Hierarchy using **Parameters 35 - [M-S Input]** and **36 - [M-S Output]**, see Setting the I/O Configuration on page 3-8.

When using Datalinks, up to 8 drive [Data In xx] parameters (300…307) and/or up to 8 [Data Out xx] parameters (310…317) must be assigned to point to the appropriate drive parameters for your application.

5. After setting the information in the drive's New Module screen, click **OK**. The Module Properties screen appears.

6. Click the Connection tab (Figure 4.21).

Figure 4.21 Module Properties Connection Tab Screen



7. In the "Requested Packet Interval (RPI)" box, set the value to 5.0 milliseconds or greater. This value determines the maximum interval that a controller should use to move data to and from the adapter. To conserve bandwidth, use higher values for communicating with low priority devices. For this example, leave the "Inhibit Module" and Major Fault …" boxes unchecked.

8. Click **OK**. The new node (for this example, "My_PowerFlex_70_EC_Drive") now appears under the bridge (for this example, "My_EtherNet_IP_Bridge") in the I/O Configuration folder. If you double-click on the Controller Tags, you will see that module-defined data types and tags have been automatically created (Figure 4.22). After you save and download the configuration, these tags allow you to access the Input and Output data of the drive via the controller's ladder logic.

For this example, all Datalinks (A, B, C, and D) are enabled. The Input Size is set to 12 words and the Output Size is set to 10 words. Also, the following adapter I/O parameters are set to these values:

Adapter Parameter No.	Setting
23 - [DPI I/O Cfg]	xxxx xxxx xxx1 1111
35 - [M-S Input]	xxxx xxxx xxx1 1111
36 - [M-S Output]	xxxx xxxx xxx1 1111

9. Reset the adapter (see Resetting the Adapter on page 3-17) or power cycle the drive.

   For the drive speed reference and Datalink parameter values and the adapter setup parameter values, refer to Drive and Adapter Parameter Settings on page 5-12.

Figure 4.22 Controller Tags

Name	Value	Force Mask	Style	Data Type
+ My_PowerFlex_70_EC_Drive:C	{...}	{...}		AB:ETHERNET_...

+ My_PowerFlex_70_EC_Drive:O.Data[8]	0		Decimal	INT
+ My_PowerFlex_70_EC_Drive:O.Data[9]	0		Decimal	INT

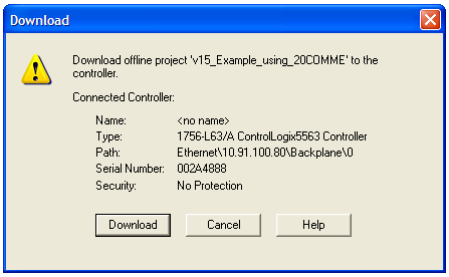
Saving the I/O Configuration to the Controller

After adding the bridge and drive/adapter to the I/O configuration, you must download the configuration to the controller. You should also save the configuration to a file on your computer.

TIP: When using RSLogix 5000 version 16 (or later), you can add the I/O configuration of a Generic Profile while the controller is online and in the Run mode.

1. In the RSLogix 5000 window, select **Communications > Download**. The Download dialog box (Figure 4.23) appears.

Figure 4.23 Download Dialog Box



TIP: If a message box reports that RSLogix 5000 is unable to go online, select **Communications > Who Active** to find your controller in the Who Active screen. After finding and selecting the controller, click **Set Project Path** to establish the path. If your controller does not appear, you need to add or configure the EtherNet/IP driver in RSLinx. See Using RSLinx Classic on page 4-1 for details.

2. Click **Download** to download the configuration to the controller. When the download is successfully completed, RSLogix 5000 goes into the Online mode and the I/O OK box in the upper-left of the screen should be steady green.

3. Select **File > Save**. If this is the first time you saved the project, the Save As dialog box appears. Navigate to a folder, type a file name, and click **Save** to save the configuration to a file on your computer.

   To ensure that the present project configuration values are saved, RSLogix 5000 prompts you to upload them. Click **Yes** to upload/save.

4. Any Datalinks that were enabled in the controller and adapter during I/O configuration (Table 4.A, Table 4.B or Table 4.C) must also be configured in the drive (for example, Datalink parameters 300…317 in PowerFlex 70/700 drives). Each Datalink being used must be assigned to a specific parameter in the drive or connected peripheral. If this is not done, the controller will receive or send placeholder data instead of actual drive or peripheral parameter values.

5. Place the controller in Remote Run or Run Mode.

Limitations When Using PLC-5, SLC 500 or MicroLogix 1100/1400

Controlling I/O with explicit messages is relatively complex compared to normal implicit I/O control.

ControlLogix and CompactLogix controllers with EtherNet/IP provide the easiest and most integrated form of implicit I/O control for a PowerFlex drive. Programming software RSLogix 5000 version 16 (or later) for ControlLogix and CompactLogix controllers contains Drive Add-On Profiles for PowerFlex drives that, with a few clicks of the mouse, automatically create all controller tags and an implicit connection at the specified Requested Packet Interval to control the drive. This connection is monitored at both ends to ensure that the controller and drive are communicating. A watchdog will cause a drive fault if the drive does not respond within approximately 100 milliseconds. Therefore, using a ControlLogix or CompactLogix controller is by far the much preferred method of controlling drives on EtherNet/IP.

If you are not using either of these type of controllers, then PowerFlex drives on EtherNet/IP can be controlled with explicit messages using PLC-5, SLC 500 or MicroLogix 1100/1400 controllers with the following limitations:

- An explicit message is a much slower form of control and is non-deterministic. This means that you cannot guarantee how long the drive will take to start up or stop when the command is given. Therefore, all equipment used in this manner should be subject to a risk assessment, taking into account the mechanical and electrical implementation.
- A timeout value (in seconds) in the adapter will issue a drive fault if a message is not received from the controller within the specified time. However, the controller has no way of detecting a loss of communications to the drive until the next cycle of explicit messages. This is another factor in the risk assessment.
- Any additional drives to be controlled will require additional explicit messages for their control, and they need to be carefully sequenced. Most controllers have small communication queues (refer to its User Manual), which need to be carefully managed if messages are not to be lost.
- Each controller has a limited number of communication connections (refer to its User Manual for maximum connections), which will limit the number of drives that can be connected.

In summary, unlike a ControlLogix or CompactLogix controller, programming a PLC-5, SLC 500 or MicroLogix 1100/1400 controller using RSLogix 5 or RSLogix 500 software with explicit messages is more difficult, and produces a more complex program.

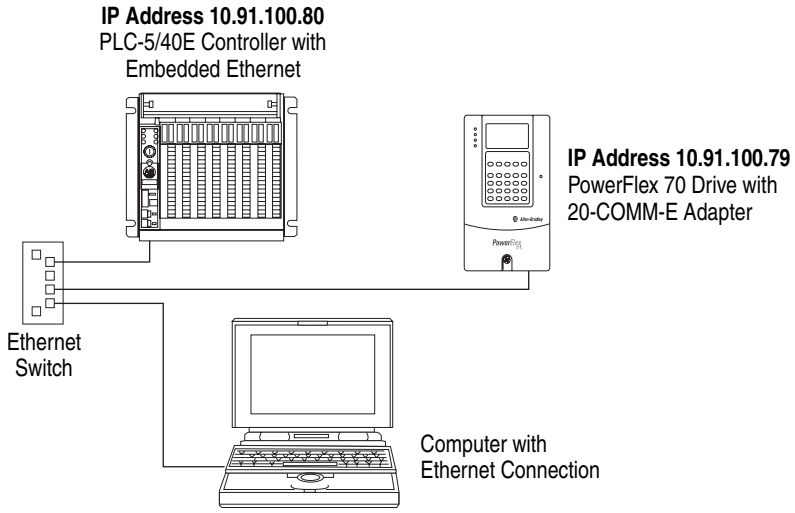
PLC-5 Example

Important: The PLC-5 must be Series E (Rev. D.1 or higher) to support the MultiHop feature that routes messaging to the drive.

Example Network

After the adapter is configured, the connected drive and adapter will be a single node on the network. This section provides the steps needed to configure a simple EtherNet/IP network (see Figure 4.24). In our example, we will configure a PLC-5/40E controller to communicate with a drive using Logic Command/Status, Reference/Feedback, and Datalinks over the network.

Figure 4.24 PLC-5 Example EtherNet/IP Network



NOTE: Information for PowerFlex 750-Series drives has been added to this manual where applicable.

Configuring Parameters for Network I/O

Since the I/O for the drive is message-based, there is no need to configure any I/O inside the RSLogix 5 (version 7 or later) project until using the I/O as described in Chapter 5.

However, to get the adapter to operate with the I/O created in Chapter 5, you need to configure the adapter to accept the I/O and the drive to point to the appropriate Datalinks.

1. For this example, the following adapter I/O parameters are set to these values:

Adapter Parameter No.	Setting
23 - [DPI I/O Cfg]	xxxx xxxx xxx1 1111
35 - [M-S Input]	xxxx xxxx xxx1 1111
36 - [M-S Output]	xxxx xxxx xxx1 1111

2. Reset the adapter (see Resetting the Adapter on page 3-17) or power cycle the drive.

   For the drive speed reference and Datalink parameter values and the adapter setup parameter values, refer to Drive and Adapter Parameter Settings on page 5-18.

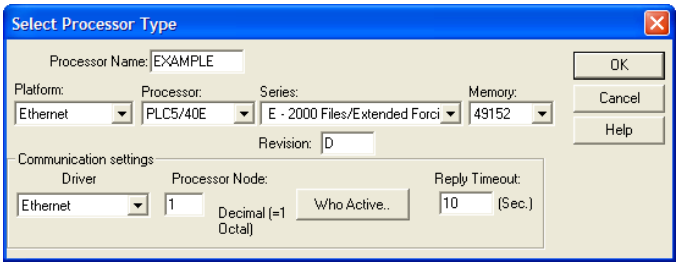
Creating RSLogix 5 (version 7 or later) Project

To transmit (read and write) data between the controller and drive, you must create message instructions that allocate data table addresses in the controller for Logic Command/Status, Reference/Feedback, and Datalinks.

Selecting the Controller

1. Start RSLogix 5. The RSLogix 5 window appears. Select **File > New** to display the Select Processor Type screen (Figure 4.25).

Figure 4.25 PLC-5 Select Processor Type Screen



2. Assign a name for the processor. From the pull-down fields, select the appropriate choices to match your PLC-5 controller and application, and click **OK**. The RSLogix 5 project window appears.

Creating PLC-5 Ladder Logic for the Control Timeout

1. In the RSLogix 5 project window treeview under Program Files double-click on LAD 2.

2. Insert a ladder rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG10:n), and
   n is an unused element of the data file chosen for xx (for example, MG10:0)

   Then press **Enter**.

3. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

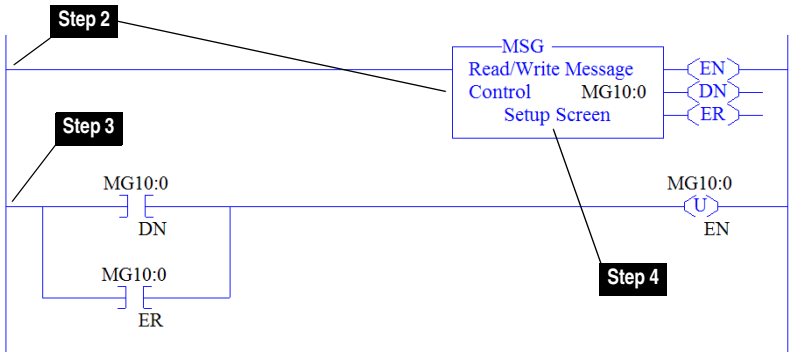
   xx and n must correspond to the assigned data file number and element (for example, MG10:0) for the message created in Step 2.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

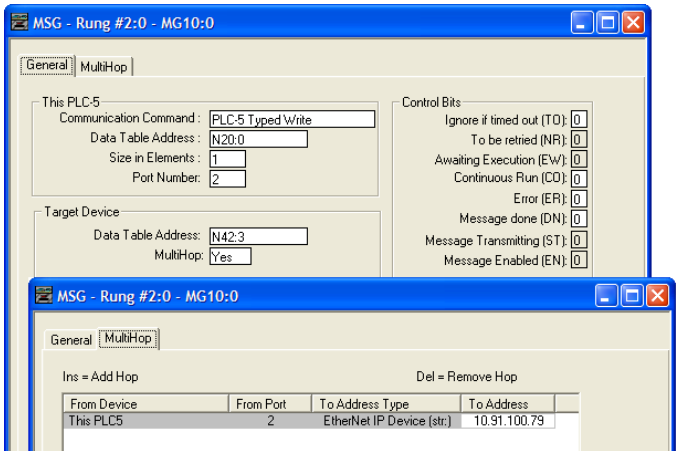
4. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.27).

Figure 4.26 PLC-5 Ladder Logic for the Control Timeout



5. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.27 PLC-5 Message Configuration Screens for the Control Timeout



General Tab Box	Setting
This PLC-5	
Communication Command	**PLC-5 Typed Write**. The controller type and command type for the controller to write the control timeout value to the drive.
Data Table Address (1)	**N20:0**. An unused controller data table address containing the control timeout value to be written.
Size in Elements (2)	**1**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Port Number	**2**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Data Table Address (3)	**N42:3**. Specific starting address of the destination file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G...Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For details on setting the control timeout value and its function, see N-Files on page C-10. The Control Timeout (N42:3) is stored in RAM. If the 20-COMM-E adapter is power cycled, the Control Timeout Message must be re-sent. If the Control Timeout is not changed from a non-zero value, the control message (page 4-28) will error out.

TIP: The Control Timeout (N42:3) must be changed to a non-zero value (5…20 seconds recommended). If the Control Timeout is not changed from a non-zero value, the control message (page 4-28) will error out. The Control Timeout is stored in RAM. If the adapter is power cycled, the Control Timeout Message must be re-sent.

Creating PLC-5 Ladder Logic for the Logic Status, Feedback, and Datalink Out

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG11:n), and
   n is an unused element of the data file chosen for xx (for example, MG11:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

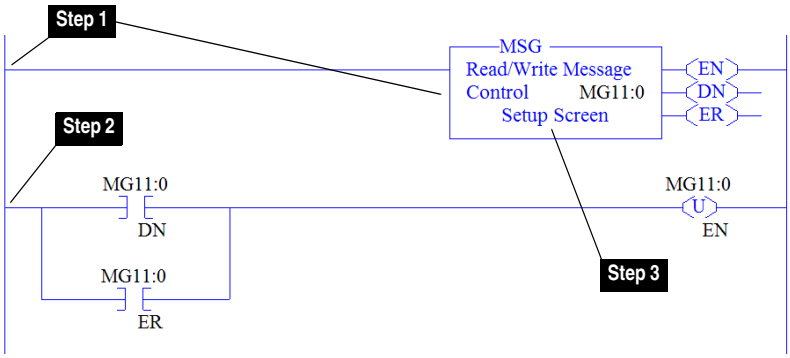
   xx and n must correspond to the assigned data file number and element (for example, MG11:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

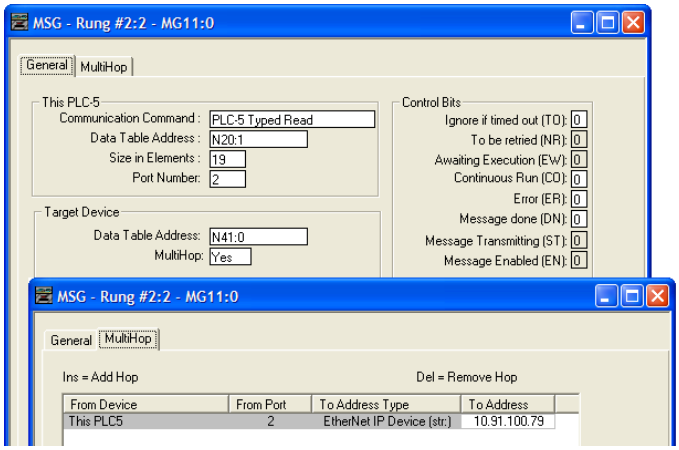
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.29).

Figure 4.28 PLC-5 Ladder Logic for the Logic Status, Feedback, and Datalink Out



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.29 PLC-5 Message Configuration Screens for the Logic Status, Feedback, and Datalink Out



General Tab Box	Setting
This PLC-5	
Communication Command	**PLC-5 Typed Read**. The controller type and command type for the controller to read data from the drive.
Data Table Address (1)	**N20:1**. An unused controller data table address containing the data to be read from the drive.
Size in Elements (2)	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Port Number	**2**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Data Table Address (3)	**N41:0**. Specific starting address of the source file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For N-File details, see N-Files on page C-10.

Creating PLC-5 Ladder Logic for the Logic Command, Reference, and Datalink In

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG12:n), and
   n is an unused element of the data file chosen for xx (for example, MG12:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

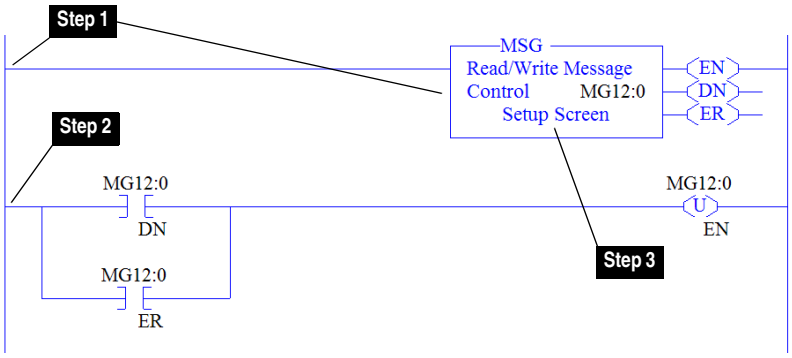
   xx and n must correspond to the assigned data file number and element (for example, MG12:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

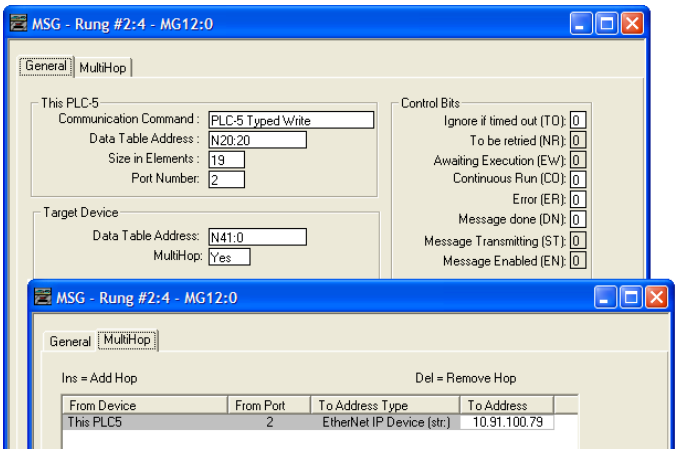
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.31).

Figure 4.30 PLC-5 Ladder Logic for the Logic Command, Reference, and Datalink In



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.31 PLC-5 Message Configuration Screens for the Logic Command, Reference, and Datalink In



General Tab Box	Setting
This PLC-5	
Communication Command	**PLC-5 Typed Write**. The controller type and command type for the controller to write data to the drive.
Data Table Address (1)	**N20:20**. An unused controller data table address containing the data to be written to the drive.
Size in Elements (2)	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Port Number	**2**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Data Table Address (3)	**N41:0**. Specific starting address of the destination file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For N-File details, see N-Files on page C-10.

TIP: This message will error out if the Control Timeout value is not changed from a non-zero value. Refer to page 4-24 for writing a value to the Control Timeout.

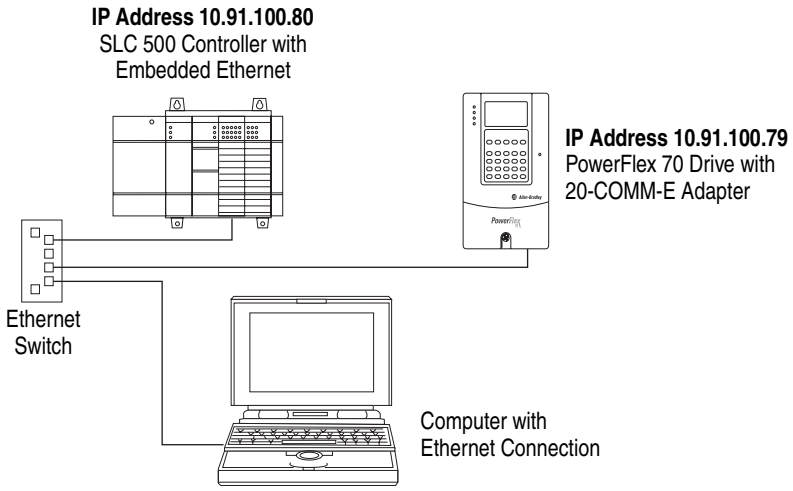
TIP: If the controller is controlling more than one drive, it is recommended to intersperse the control I/O messaging for each drive to conserve network bandwidth and decrease response time. That is, sequence the message instructions for each drive so that its group of messages will occur at a different time than those for another drive.

SLC 500 Example

Example Network

After the adapter is configured, the connected drive and adapter will be a single node on the network. This section provides the steps needed to configure a simple EtherNet/IP network (see Figure 4.32). In our example, we will configure a SLC 500 controller to communicate with a drive using Logic Command/Status, Reference/Feedback, and Datalinks over the network.

Figure 4.32 SLC 500 Example EtherNet/IP Network



NOTE: Information for PowerFlex 750-Series drives has been added to this manual where applicable.

Configuring Parameters for Network I/O

Since the I/O for the drive is message-based, there is no need to configure any I/O inside the RSLogix 500 (version 7 or later) project until using the I/O as described in Chapter 5.

However, to get the adapter to operate with the I/O created in Chapter 5, we need to configure the adapter to accept the I/O and drive to point to the appropriate Datalinks.

1. For this example, the following adapter I/O parameters are set to these values:

Adapter Parameter No.	Setting
23 - [DPI I/O Cfg]	xxxx xxxx xxx1 1111
35 - [M-S Input]	xxxx xxxx xxx1 1111
36 - [M-S Output]	xxxx xxxx xxx1 1111

2. Reset the adapter (see Resetting the Adapter on page 3-17) or power cycle the drive.

   For the drive speed reference and Datalink parameter values and the adapter setup parameter values, refer to Drive and Adapter Parameter Settings on page 5-18.

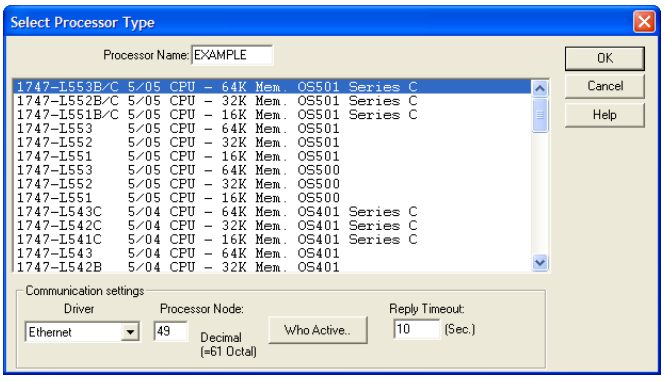
Creating RSLogix 500 (version 7 or later) Project

To transmit (read and write) data between the controller and drive, you must create message instructions that allocate data table addresses in the controller for Logic Command/Status, Reference/Feedback, and Datalinks.

Selecting the Controller

1. Start RSLogix 500. The RSLogix 500 window appears. Select **File > New** to display the Select Processor Type screen (Figure 4.33).

Figure 4.33 SLC 500 Select Processor Type Screen



2. Assign a name for the processor. In the list, select a 1747-L55x type controller. Then select the appropriate choices for the fields in the screen to match your application, and click **OK**. The RSLogix 500 project window appears.

Creating SLC 500 Ladder Logic for the Control Timeout

1. In the RSLogix 500 project window treeview under Program Files double-click on LAD 2.

2. Insert a ladder rung, double-click on the rung to display the rung editor, and enter **MSG WRITE 500CPU LOCAL Nxx:n**, where:

   xx is an unused data file number (for example, N10:n), and
   n is an unused element of the data file chosen for xx (for example, N10:0)

   Then press **Enter**.

3. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC Nxx:n/DN NXB XIC Nxx:n/ER BND OTU Nxx:n/EN**, where:

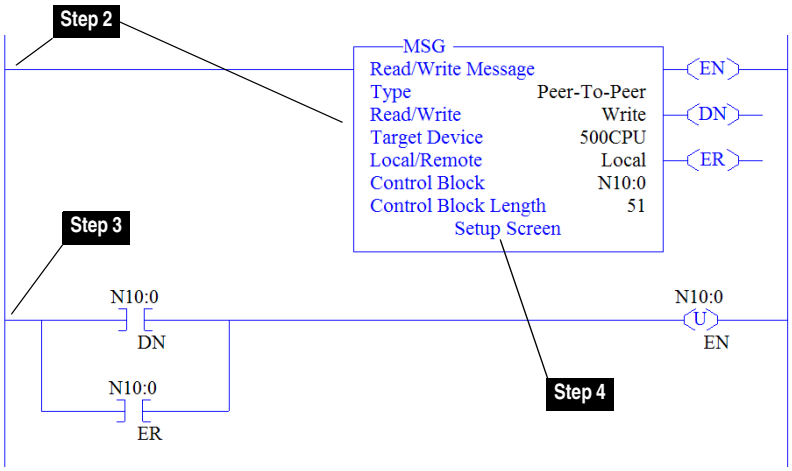
   xx and n must correspond to the assigned data file number and element (for example, N10:0) for the message created in Step 2.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

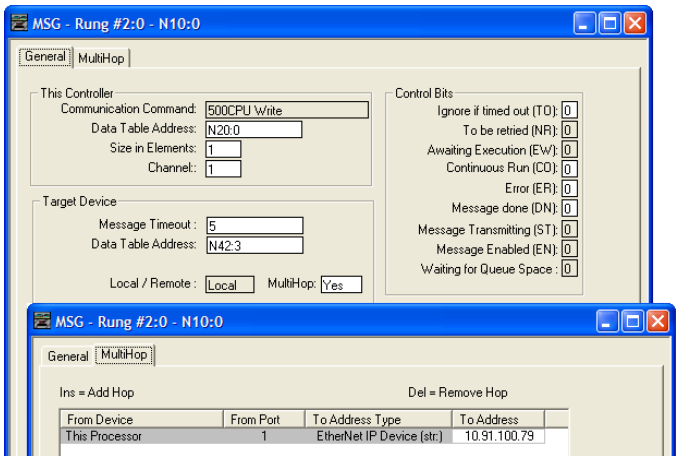
4. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.35).

Figure 4.34 SLC 500 Ladder Logic for the Control Timeout



5. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.35 SLC 500 Message Configuration Screens for the Control Timeout



General Tab Box	Setting
This Controller	
Communication Command	This setting is unavailable (grayed out) and is established when the message is created in the ladder rung.
Data Table Address (1)	**N20:0**. An unused controller data table address containing the control timeout value to be written.
Size in Elements (2)	**1**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Channel	**1**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address (3)	**N42:3**. Specific starting address of the destination file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For details on setting the control timeout value and its function, see N-Files on page C-10. The Control Timeout (N42:3) is stored in RAM. If the 20-COMM-E adapter is power cycled, the Control Timeout Message must be re-sent. If the Control Timeout is not changed from a non-zero value, the control message (page 4-36) will error out.

TIP: The Control Timeout (N42:3) must be changed to a non-zero value (5…20 seconds recommended). If the Control Timeout is not changed from a non-zero value, the control message (page 4-36) will error out. The Control Timeout is stored in RAM. If the adapter is power cycled, the Control Timeout Message must be re-sent.

Creating SLC 500 Ladder Logic for the Logic Status, Feedback, and Datalink Out

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG READ 500CPU LOCAL Nxx:n**, where:

   xx is an unused data file number (for example, N11:n), and
   n is an unused element of the data file chosen for xx (for example, N11:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC Nxx:n/DN NXB XIC Nxx:n/ER BND OTU Nxx:n/EN**, where:

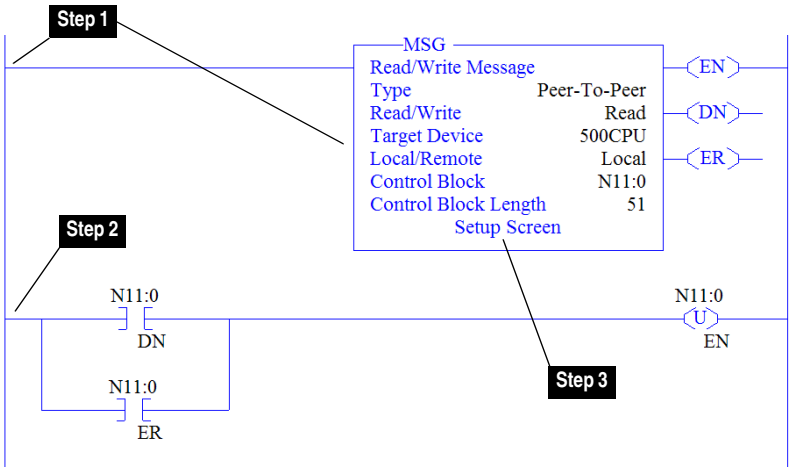
   xx and n must correspond to the assigned data file number and element (for example, N11:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

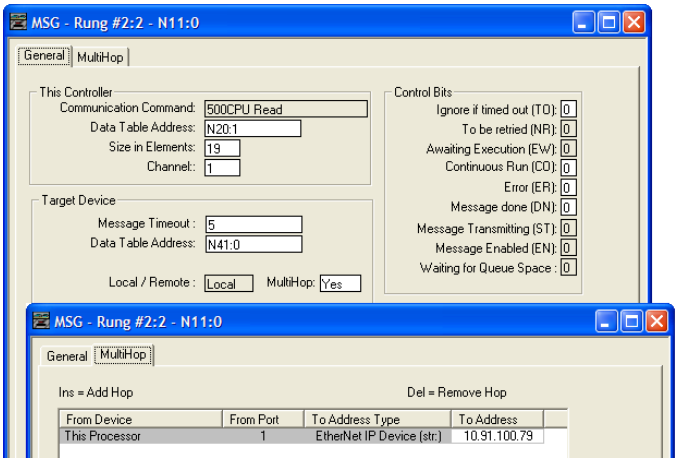
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.37).

Figure 4.36 SLC 500 Ladder Logic for the Logic Status, Feedback, and Datalink Out



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.37 SLC 500 Message Configuration Screens for the Logic Status, Feedback, and Datalink Out



General Tab Box	Setting
This Controller	
Communication Command	This setting is unavailable (grayed out) and is established when the message is created in the ladder rung.
Data Table Address (1)	**N20:1**. An unused controller data table address containing the data to be read from the drive.
Size in Elements (2)	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Channel	**1**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address (3)	**N41:0**. Specific starting address of the source file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For N-File details, see N-Files on page C-10.

Creating SLC 500 Ladder Logic for the Logic Command, Reference, and Datalink In

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG WRITE 500CPU LOCAL Nxx:n**, where:

   xx is an unused data file number (for example, N12:n), and
   n is an unused element of the data file chosen for xx (for example, N12:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC Nxx:n/DN NXB XIC Nxx:n/ER BND OTU Nxx:n/EN**, where:

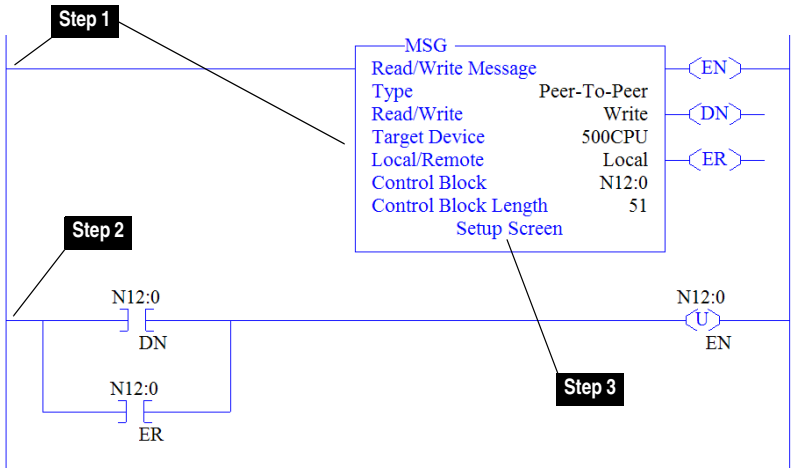
   xx and n must correspond to the assigned data file number and element (for example, N12:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

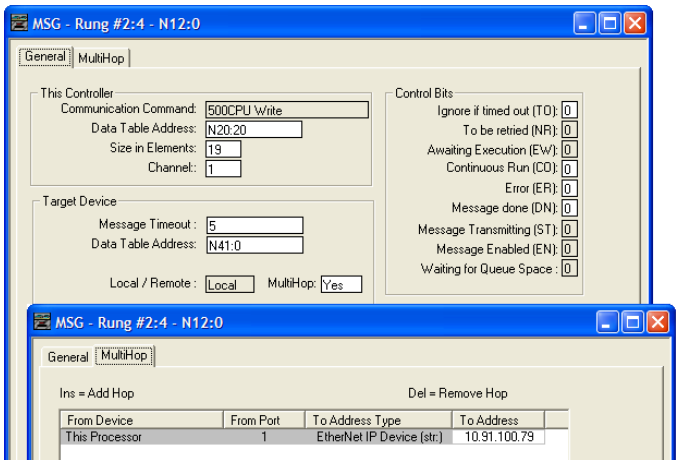
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.39).

Figure 4.38 SLC 500 Ladder Logic for the Logic Command, Reference, and Datalink In



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.39 SLC 500 Message Configuration Screens for the Logic Command, Reference, and Datalink In



General Tab Box	Setting
This Controller	
Communication Command	This setting is unavailable (grayed out) and is established when the message is created in the ladder rung.
Data Table Address [1]	**N20:20**. An unused controller data table address containing the data to be written to the drive.
Size in Elements [2]	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Channel	**1**. Controller port to which the network is connected.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address [3]	**N41:0**. Specific starting address of the destination file in the drive.
MultiHop	**Yes**. Enables communication to allow network messaging to be routed to the adapter/drive. When "Yes" is selected, a MultiHop tab appears on the message configuration screen.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

[1] For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

[2] For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

[3] For N-File details, see N-Files on page C-10.

TIP: This message will error out if the Control Timeout value is not changed from a non-zero value. Refer to page 4-32 for writing a value to the Control Timeout.

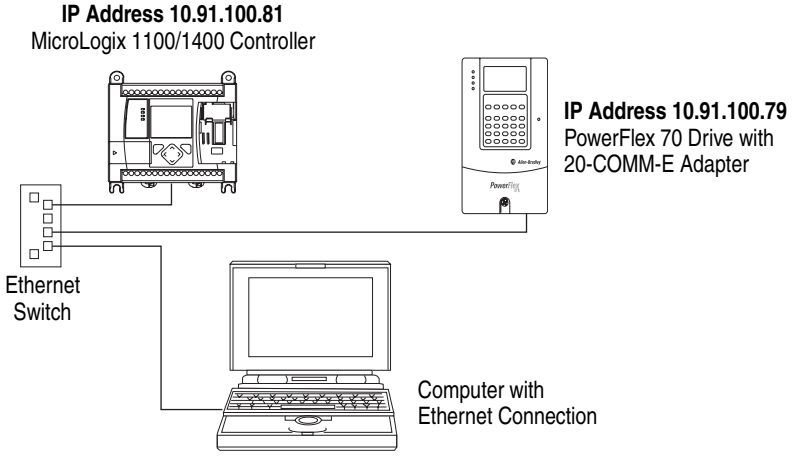
TIP: If the controller is controlling more than one drive, it is recommended to intersperse the control I/O messaging for each drive to conserve network bandwidth and decrease response time. That is, sequence the message instructions for each drive so that its group of messages will occur at a different time than those for another drive.

MicroLogix 1100/1400 Example

Example Network

After the adapter is configured, the connected drive and adapter will be a single node on the network. This section provides the steps needed to configure a simple EtherNet/IP network (see Figure 4.40). In our example, we will configure a MicroLogix 1100 controller to communicate with a drive using Logic Command/Status, Reference/Feedback, and Datalinks over the network.

Figure 4.40 MicroLogix 1100/1400 Example EtherNet/IP Network



NOTE: Information for PowerFlex 750-Series drives has been added to this manual where applicable.

Configuring Parameters for Network I/O

Since the I/O for the drive is message-based, there is no need to configure any I/O inside the RSLogix 500 (version 7 or later) project until using the I/O as described in Chapter 5.

However, to get the adapter to operate with the I/O created in Chapter 5, we need to configure the adapter to accept the I/O and drive to point to the appropriate Datalinks.

1. For this example, the following adapter I/O parameters are set to these values:

Adapter Parameter No.	Setting
23 - [DPI I/O Cfg]	xxxx xxxx xxx1 1111
35 - [M-S Input]	xxxx xxxx xxx1 1111
36 - [M-S Output]	xxxx xxxx xxx1 1111

2. Reset the adapter (see Resetting the Adapter on page 3-17) or power cycle the drive.

   For the drive speed reference and Datalink parameter values and the adapter setup parameter values, refer to Drive and Adapter Parameter Settings on page 5-18.

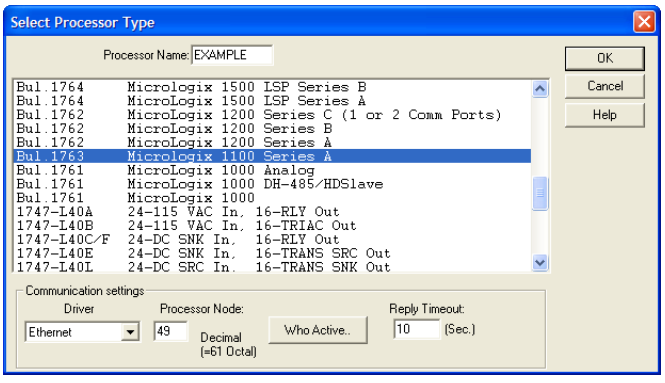
Creating RSLogix 500 (version 7 or later) Project

To transmit (read and write) data between the controller and drive, you must create message instructions that allocate data table addresses in the controller for Logic Command/Status, Reference/Feedback, and Datalinks.

Selecting the Controller

1. Start RSLogix 500. The RSLogix 500 window appears. Select **File > New** to display the Select Processor Type screen (Figure 4.41).

Figure 4.41 MicroLogix 1100 Select Processor Type Screen



2. Assign a name for the processor. In the list, select the MicroLogix 1100. Then select the appropriate choices for the fields in the screen to match your application, and click **OK**. The RSLogix 500 project window appears.

Creating MicroLogix 1100/1400 Ladder Logic for the Control Timeout

1. In the RSLogix 500 project window treeview under Program Files double-click on LAD 2.

2. Insert a ladder rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG10:n), and
   n is an unused element of the data file chosen for xx (for example, MG10:0)

   Then press **Enter**.

3. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

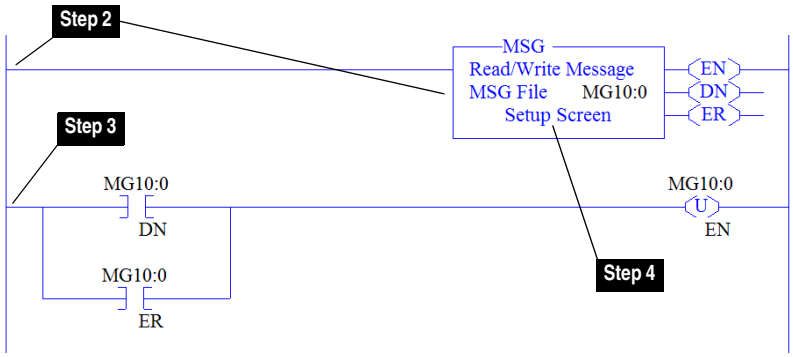
   xx and n must correspond to the assigned data file number and element (for example, MG10:0) for the message created in Step 2.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

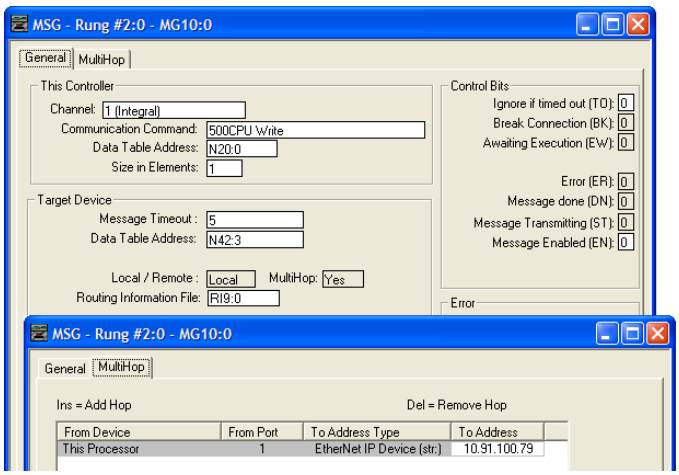
4. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.43).

Figure 4.42 MicroLogix 1100/1400 Ladder Logic for the Control Timeout



5. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.43 MicroLogix 1100/1400 Message Configuration Screens for the Control Timeout



General Tab Box	Setting
This Controller (data for MicroLogix 1100)	
Channel	**1 (integral)**. Controller port to which the network is connected.
Communication Command	**500CPU Write**. The controller type and command type for the controller to read or write data. Since the MicroLogix 1100 is part of the SLC-500 controller family, the “500CPU” controller type was selected. The “Write” command type was selected to write the control timeout value to the drive.
Data Table Address (1)	**N20:0**. An unused controller data table address containing the control timeout value to be written.
Size in Elements (2)	**1**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address (3)	**N42:3**. Specific starting address of the destination file in the drive.
Routing Information File	**RI9:0**. An unused routing information file for the controller.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For details on setting the control timeout value and its function, see N-Files on page C-10. The Control Timeout (N42:3) is stored in RAM. If the 20-COMM-E adapter is power cycled, the Control Timeout Message must be re-sent. If the Control Timeout is not changed from a non-zero value, the control message (page 4-44) will error out.

TIP: The Control Timeout (N42:3) must be changed to a non-zero value (5…20 seconds recommended). If the Control Timeout is not changed from a non-zero value, the control message (page 4-44) will error out. The Control Timeout is stored in RAM. If the adapter is power cycled, the Control Timeout Message must be re-sent.

Creating MicroLogix 1100/1400 Ladder Logic for the Logic Status, Feedback, and Datalink Out

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG11:n), and
   n is an unused element of the data file chosen for xx (for example, MG11:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

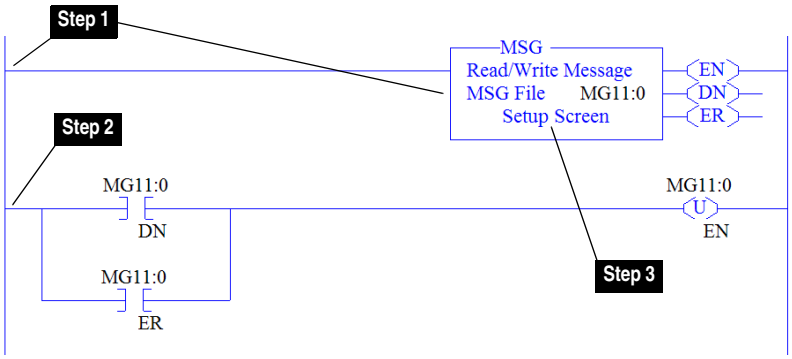
   xx and n must correspond to the assigned data file number and element (for example, MG11:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

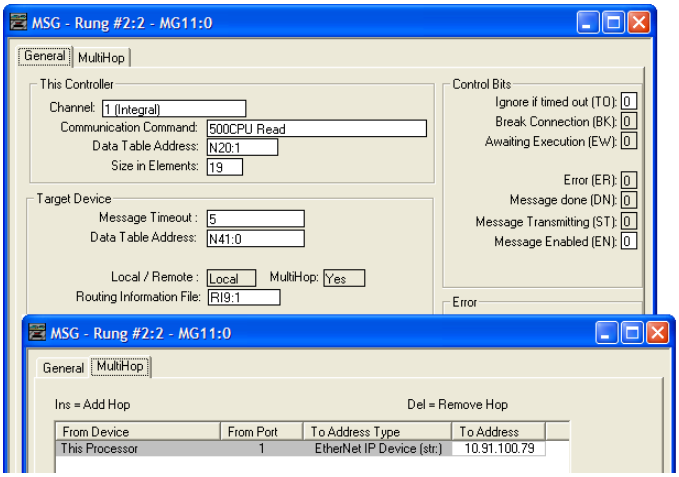
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.45).

Figure 4.44 MicroLogix 1100/1400 Ladder Logic for the Logic Status, Feedback, and Datalink Out



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.45 MicroLogix 1100/1400 Message Configuration Screens for the Logic Status, Feedback, and Datalink Out



General Tab Box	Setting
This Controller (data for MicroLogix 1100)	
Channel	**1 (integral)**. Controller port to which the network is connected.
Communication Command	**500CPU Read**. The controller type and command type for the controller to read or write data. Since the MicroLogix 1100 is part of the SLC-500 controller family, the “500CPU” controller type was selected. The “Read” command type was selected to read data from the drive.
Data Table Address [1]	**N20:1**. An unused controller data table address containing the data to be read from the drive.
Size in Elements [2]	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address [3]	**N41:0**. Specific starting address of the source file in the drive.
Routing Information File	**RI9:1**. An unused routing information file for the controller.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

[1] For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

[2] For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

[3] For N-File details, see N-Files on page C-10.

Creating MicroLogix 1100/1400 Ladder Logic for the Logic Command, Reference, and Datalink In

1. Insert another separate rung, double-click on the rung to display the rung editor, and enter **MSG MGxx:n**, where:

   xx is an unused data file number (for example, MG12:n), and
   n is an unused element of the data file chosen for xx (for example, MG12:0)

   Then press **Enter**.

2. Insert another separate rung, double-click on the rung to display the rung editor, and enter **BST XIC MGxx:n/DN NXB XIC MGxx:n/ER BND OTU MGxx:n/EN**, where:

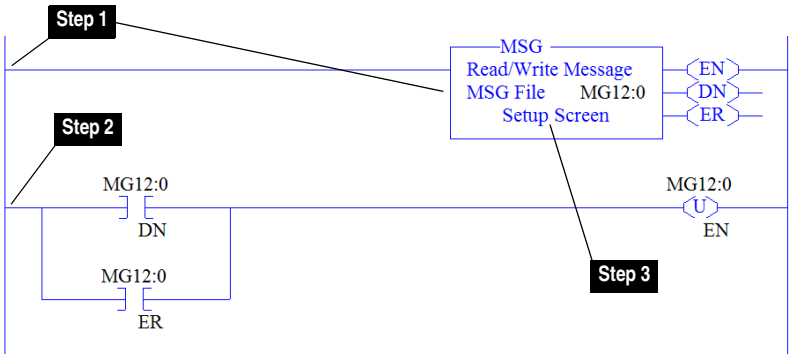
   xx and n must correspond to the assigned data file number and element (for example, MG12:0) for the message created in Step 1.

   Important: The information must be entered with appropriate numbers for “xx” and “n” for your application, and with spaces and forward slashes exactly as shown.

   Then press **Enter**.

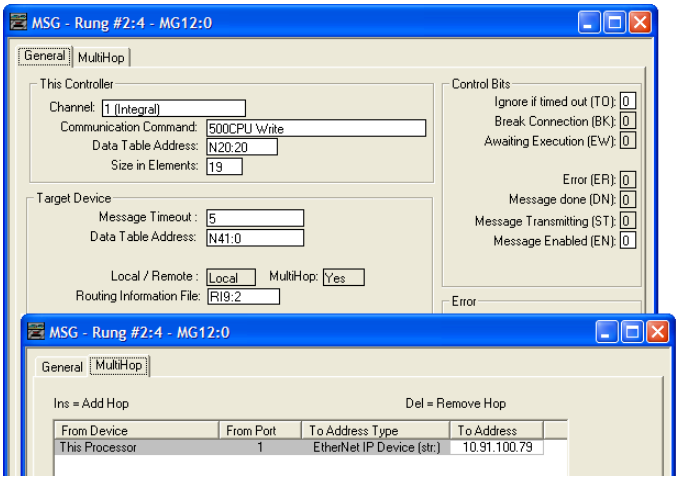
3. In the MSG instruction, double-click on Setup Screen to launch the message configuration screen (Figure 4.47).

Figure 4.46 MicroLogix 1100/1400 Ladder Logic for the Logic Command, Reference, and Datalink In



4. Configure the General tab by entering or verifying the information shown in the screen.

Figure 4.47 MicroLogix 1100/1400 Message Configuration Screens for the Logic Command, Reference, and Datalink In



General Tab Box	Setting
This Controller (data for MicroLogix 1100)	
Channel	**1 (integral)**. Controller port to which the network is connected.
Communication Command	**500CPU Write**. The controller type and command type for the controller to read or write data. Since the MicroLogix 1100 is part of the SLC-500 controller family, the “500CPU” controller type was selected. The “Write” command type was selected to write data to the drive.
Data Table Address (1)	**N20:20**. An unused controller data table address containing the data to be written to the drive.
Size in Elements (2)	**19**. Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Target Device (data for adapter/drive)	
Message Timeout	**5**. Message timeout duration in seconds.
Data Table Address (3)	**N41:0**. Specific starting address of the destination file in the drive.
Routing Information File	**RI9:2**. An unused routing information file for the controller.
MultiHop Tab Box	**Setting**
To Address	**10.91.100.79.** The IP address of the adapter connected to the drive.

(1) For details on data table addresses for this example project, refer to Table 5.G…Table 5.J starting on page 5-20.

(2) For details to determine element size for a specific drive, refer to Understanding Controller Data Table Addresses on page 5-19.

(3) For N-File details, see N-Files on page C-10.

TIP: This message will error out if the Control Timeout value is not changed from a non-zero value. Refer to page 4-40 for writing a value to the Control Timeout.

TIP: If the controller is controlling more than one drive, it is recommended to intersperse the control I/O messaging for each drive to conserve network bandwidth and decrease response time. That is, sequence the message instructions for each drive so that its group of messages will occur at a different time than those for another drive.

Notes:

Using the I/O

This chapter provides information and examples that explain how to control, configure, and monitor a PowerFlex 7-Class drive using the configured I/O.

Topic	Page
About I/O Messaging	5-1
Understanding the I/O Image	5-2
Using Logic Command/Status	5-5
Using Reference/Feedback	5-5
Using Datalinks	5-7
Example Ladder Logic Program Information	5-9
ControlLogix Example	5-10
PLC-5, SLC 500 or MicroLogix 1100/1400 Example	5-18

ATTENTION: Risk of injury or equipment damage exists. The examples in this publication are intended solely for purposes of example. There are many variables and requirements with any application. Rockwell Automation, Inc. does not assume responsibility or liability (to include intellectual property liability) for actual use of the examples shown in this publication.

About I/O Messaging

On CIP-based networks, including EtherNet/IP, I/O connections are used to transfer the data which controls the PowerFlex drive and sets its Reference. I/O can also be used to transfer data to and from Datalinks in PowerFlex 7-Class drives.

The adapter provides many options for configuring and using I/O, including:

- Configuring the size of I/O by enabling or disabling the Logic Command/Reference and Datalinks.
- Setting a Master-Slave hierarchy or a Peer-to-Peer hierarchy.

Chapter 3, Configuring the Adapter, and Chapter 4, Configuring the I/O, discuss how to configure the adapter and controller on the network for these options. The Glossary defines the different options. This chapter discusses how to use I/O after you have configured the adapter and controller.

Understanding the I/O Image

The terms *input* and *output* are defined from the controller's point of view. Therefore, output I/O is data that is produced by the controller and consumed by the adapter. Input I/O is status data that is produced by the adapter and consumed as input by the controller. The I/O image will vary based on:

- Size (either 16-bit or 32-bit) of the Reference/Feedback words and Datalink words used by the drive. To determine the size of the Reference/Feedback and Datalinks, view adapter **Parameters 18 - [Ref/Fdbk Size]** and **19 - [Datalink Size]**. For information to access parameters, see Using the PowerFlex 7-Class HIM on page 3-2.
- Configuration of I/O (**Parameter 23 - [DPI I/O Cfg]**). If all I/O is not enabled, the image is truncated. The image always uses consecutive words starting at word 0.
- **ControlLogix/CompactLogix Controllers only**—The drive profile used in RSLogix 5000 (drive Add-On Profile in version 16 or later, Classic Profile in versions 13…15, or Generic Profile in all versions).

ControlLogix Controller Image

Since the drive Add-On Profile in RSLogix 5000 version 16 (or later) and the Classic Profile (versions 13…15) provide descriptive controller tags, the I/O image (tag size and location) is automatically configured based on the drive being used. When using the Generic Profile (page 4-15) in RSLogix 5000, however, controller tags are not descriptive or defined.

The ControlLogix controller I/O image changes depending on the size of the drive's Reference/Feedback and Datalinks. Table 5.A, Table 5.B, and Table 5.C show the I/O image when using various PowerFlex 7-Class drives, and all Datalinks enabled.

PLC-5, SLC 500 or MicroLogix 1100/1400 Controller Image

The I/O image for these controllers always has 19 words of output and 19 words of input. However, depending on the size of the drive's Reference/ Feedback and Datalinks, specific words in the I/O image may not be used. Table 5.D, Table 5.E, and Table 5.F show the I/O image when using various PowerFlex 7-Class drives, and all Datalinks enabled.

Table 5.D PLC-5, SLC 500 or MicroLogix 1100/1400 I/O Image for PowerFlex 70/ 700/700H Drives and SMC Flex (16-bit Reference/Feedback and 16-bit Datalinks)

Using Logic Command/ Status

The *Logic Command* is a 16-bit word of control data produced by the scanner and consumed by the adapter. The *Logic Status* is a 16-bit word of status data produced by the adapter and consumed by the scanner. PowerFlex 750-Series drives have a 32-bit Logic Command/Status, but when using a 20-COMM-E adapter only the first 16 bits can be used.

This manual contains the bit definitions for most compatible products available at the time of publication in Appendix D, Logic Command/Status Words. For other products, refer to their documentation.

Using Reference/Feedback

The *Reference* is produced by the controller and consumed by the adapter. The *Feedback* is produced by the adapter and consumed by the controller. The size of the Reference/Feedback is determined by the drive and displayed using adapter **Parameter 18 - [Ref/Fdbk Size]**.

Size	Valid Values
16-bit	-32768 to 32767
32-bit	-2147483648 to 2147483647

When the Reference and Feedback are enabled and a ControlLogix controller with a drive Add-On Profile or Classic Profile is used, specific controller tags are automatically created, sized (16-bit or 32-bit), and placed in the I/O image.

PowerFlex 7-Class Drives (except PowerFlex 750-Series)

The Reference value is a scaled engineering value; it is NOT in Hertz or RPM. The Reference uses a “32767” scale. The “32767” endpoint of the scale is equal to the value of parameter 55 - [Maximum Freq], which has a default value of 130 Hz. For all PowerFlex 70/700 drives, default scaling is 0…15123 which is equal to 0…60.0 Hz. This is based on the formula shown below. Reference scaling is limited by drive parameter 82 - [Maximum Speed]. If the default value of 60 Hz. for parameter 82 - [Maximum Speed] is changed, the speed Reference scaling also changes. To determine Reference scaling, use:

(Parameter 82 ÷ Parameter 55) * 32767 = Scaling

Using parameter 82 and 55 default values, speed Reference scaling is:

(60 Hz ÷ 130 Hz) * 32767 = 15123

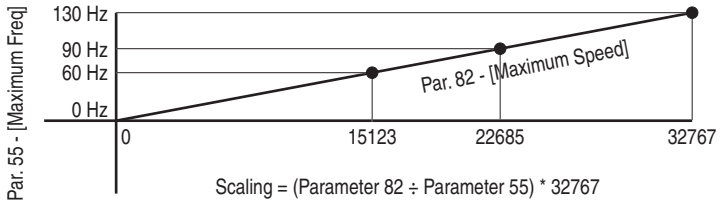
Therefore, 0…15123 = 0…60.0 Hz.

If parameter 82 - [Maximum Speed] is changed to 90 Hz, then:

(90 Hz ÷ 130 Hz) * 32767 = 22685

Therefore, 0…22685 = 0…90.0 Hz.

A graphic representation of this Reference scaling is shown below:



For PowerFlex 70 EC drives (firmware version 2.xxx or later) or PowerFlex 700 VC drives (firmware version 3.xxx or later), parameter 298 - [DPI Ref Select] was added to simplify scaling for the speed Reference. When parameter 298 - [DPI Ref Select] is set to its default “0” (Max Freq), the speed Reference scaling is as shown above. However, when parameter 298 - [DPI Ref Select] is set to “1” (Max Speed), the speed Reference scaling is equal to parameter 82 - [Max Speed]:

Parameter 82 = Scaling

Using the parameter 82 default value, speed Reference scaling is:

0…32767 = 0…60.0 Hz.

If parameter 82 - [Maximum Speed] is changed to 90 Hz, then:

90 Hz = 32767

Speed Feedback uses the same scaling as the speed Reference.

TIP: For PowerFlex 700 VC drives (firmware version 3.xxx or later), Parameter 299 - [DPI Fdbk Select] enables you to select the feedback data coming from the drive over DPI. The default is “Speed Fdbk” in Hz or RPM determined by Parameter 079 - [Speed Units]. The data selection for Parameter 299 is also displayed on the 1st line of the HIM and on DriveExplorer and DriveExecutive screens in the drive status area of the screen.

PowerFlex 750-Series Drives

The Reference value is Hz x 1000 or RPM x 1000. Drive Parameter 300 - [Speed Units] determines whether the scaling is Hz or RPM. The default scaling is Hz, where 0…60,000 equates to 0…60.000 Hz. When Parameter 300 is set to RPM, then 0…1,765,000 equates to 0…1765.000 RPM.

Using Datalinks

A Datalink is a mechanism used by PowerFlex drives to transfer data to and from the controller. Datalinks allow a drive parameter value to be read or written without using an Explicit Message. When enabled, each Datalink occupies two 16-bit or 32-bit words in both the input and output image. Use adapter **Parameter 19 - [Datalink Size]** to determine whether the drive uses 16-bit or 32-bit words for Datalinks.

Rules for Using Datalinks

- Each set of Datalink parameters in a PowerFlex drive can be used by only one adapter. If more than one adapter is connected to a single drive, multiple adapters cannot use the same Datalink.
- Parameter settings in the drive determine the data passed through the Datalink mechanism. Refer to the documentation for your drive.
- When you use a Datalink to change a value, the value is NOT written to the Non-Volatile Storage (NVS). The value is stored in volatile memory and lost when the drive loses power. Thus, use Datalinks when you need to change a value of a parameter frequently.

Datalink Scaling

PowerFlex 7-Class Drives (except PowerFlex 750-Series)

When using RSLogix 5000 version 16 (or later), Datalink scaling is done automatically. However, when using RSLogix 5000 version 15 (or earlier)—or when using a PLC-5, SLC 500 or MicroLogix 1100/1400 controller—Datalink scaling is not automatic and uses whole numbers (INTs or DINTs). Refer to the drive documentation to determine the unit resolution for the associated parameter Datalink. For example, PowerFlex 700VC drive Parameter 3 - [Output Current] has a 0.1 unit resolution.

Because Datalink scaling uses whole numbers, the Output Current value is multiplied by 10 in the adapter and then sent over the network. Suppose the actual Output Current value is 35.5 amps. Reading the associated parameter Datalink received by the controller, the value would be 355. By using ladder logic, divide the value by 10 in the controller to get the correct scaling.

PowerFlex 750-Series Drives

When using RSLogix 5000 version 16 (or later), Datalink scaling is done automatically. However, when using RSLogix 5000 version 15 (or earlier)—or when using a PLC-5, SLC 500 or MicroLogix 1100/1400 controller—Datalinks require scaling in the following way. Parameters are either 32-bit integers or REALs. When the parameter is a 32-bit integer, the data needs to be copied using a COP command to a DINT tag. (Since PLC-5, SLC 500, and MicroLogix 1100/1400 controllers do not support 32-bit integers, the data must be separated into two 16-bit integers.) When the parameter is a REAL, the data needs to be copied using a COP command to a REAL tag. Refer to subsequent sections in this chapter for ladder logic examples.

Using 16-Bit Datalinks to Read/Write 32-Bit Parameters

This subsection only pertains to PowerFlex 70 (SC or EC), PowerFlex 700 (SC), and PowerFlex 700H drives which use 16-bit Datalinks. To read or write a 32-bit parameter using 16-bit Datalinks, typically both Datalinks of a pair (A, B, C, D) are set to the same 32-bit parameter. For example, to read Parameter 10 - [Elapsed Run Time] in a PowerFlex 70 drive, both Datalink A1 Out (Parameter 310) and Datalink A2 Out (Parameter 311) are set to “10.” Datalink A1 Out will contain the least significant word (LSW) and Datalink A2 Out will contain the most significant word (MSW).

32-bit data is stored in binary as follows:

MSW	2^{31} through 2^{16}
LSW	2^{15} through 2^{0}

In this example, the Parameter 10 - [Elapsed Run Time] value of 6553.9 Hrs is read as “6553.9” in Datalink A1 Out (Parameter 310) and Datalink A2 Out (Parameter 311).

Datalink	Word	Parameter	Data (Hex)
A1 Out	LSW	10	0003
A2 Out	MSW	10	0001

Conversion Example:

Parameter 010 - [Elapsed Run Time] = 6553.9 Hrs
MSW = 0001_{hex} = 0001_{binary} = 2^{16} = 65536
LSW = 0003_{hex} =3
Engineering Value = 65536 + 3 = 65539
Parameter 10 Displayed Value = 6553.9 Hrs

Regardless of the Datalink combination, Datalink x1 Out will always contain the LSW and Datalink x2 Out will always contain the MSW. In the following example, the PowerFlex 70 drive Parameter 242 - [Power Up Marker] contains a value of 88.4541 hours.

Datalink	Word	Parameter	Data (Hex)
A2 Out	MSW	242	000D
B1 Out	LSW	242	7F3D

Conversion Example:

Parameter 242 - [Power Up Marker] = 88.4541 hours
MSW = $000D_{hex} = 1101_{binary} = 2^{19} + 2^{18} + 2^{16} = 851968$
LSW = $7F3D_{hex} = 32573$
Engineering Value = 851968 + 32573 = 884541
Parameter 242 Displayed Value = 88.4541 Hrs

Example Ladder Logic Program Information

The example ladder logic programs in the sections of this chapter are intended for and operate PowerFlex 7-Class drives.

Functions of the Example Programs

The example programs enable you to:

- Receive Logic Status information from the drive.
- Send a Logic Command to control the drive (for example, start, stop).
- Send a Reference to the drive and receive Feedback from the drive.
- Send/receive Datalink data to/from the drive.

Logic Command/Status Words

These examples use the Logic Command word and Logic Status word for PowerFlex 70/700 drives. Information for PowerFlex 750-Series drives has been added to the examples where applicable. Refer to Appendix D to view details. The definition of the bits in these words may vary if you are using a different DPI drive. Refer to the documentation for your drive.

ControlLogix Example

Creating Ladder Logic Using the RSLogix 5000 Drive Add-On Profiles (version 16 or later)

Since the drive Add-On Profile automatically created descriptive controller tags (Figure 4.12) for the entire I/O image in Chapter 4, you can use these tags to directly control and monitor the drive without creating any ladder logic program. However, if you intend to use Human Machine Interface devices (PanelView, etc.) to operate the drive and view its status, you will need to create descriptive user-defined Program tags (Figure 5.1) and a ladder logic program that will pass the Controller tag data to the Program tags.

Figure 5.1 ControlLogix Program Tags for Drive Add-On Profile Ladder Logic Program Example

Name	Style	Data Type
Command_Clear_Faults	Decimal	BOOL
Command_Forward_Reverse	Decimal	BOOL
Command_Jog	Decimal	BOOL
Command_Start	Decimal	BOOL
Command_Stop	Decimal	BOOL
+ Speed_Feedback	Decimal	DINT
+ Speed_Reference	Decimal	DINT
Status_Active	Decimal	BOOL
Status_At_Speed	Decimal	BOOL
Status_Faulted	Decimal	BOOL
Status_Forward	Decimal	BOOL
Status_Ready	Decimal	BOOL
Status_Reverse	Decimal	BOOL

An example ladder logic program that uses the automatically created descriptive Controller tags and passes their data to the user-defined Program tags is shown in Figure 5.2 and Figure 5.3. Note that the prefix for the drive Controller tags is determined by the name assigned when configuring the I/O (Chapter 4). For information on speed Reference and Feedback scaling, see PowerFlex 7-Class Drives (except PowerFlex 750-Series) on page 5-6 or PowerFlex 750-Series Drives on page 5-7.

Figure 5.2 ControlLogix Example Ladder Logic Program Using a Drive Add-On Profile for Logic Status/Feedback

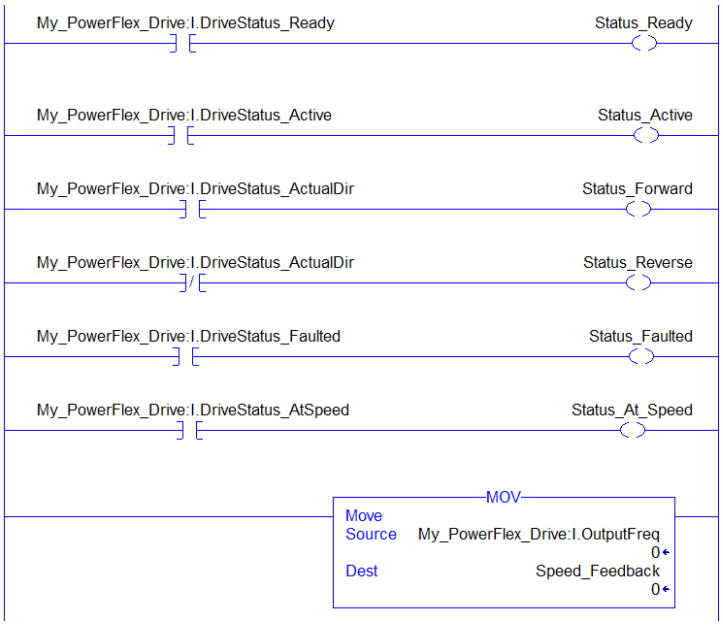


Figure 5.3 ControlLogix Example Ladder Logic Program Using a Drive Add-On Profile for Logic Command/Reference

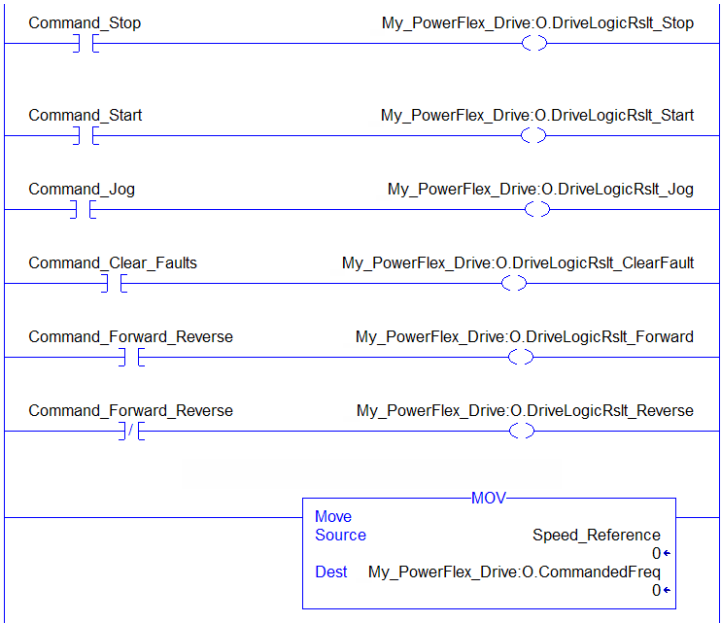


Creating Ladder Logic Using the RSLogix 5000 Classic Profile (versions 13...15)

Since the RSLogix 5000 Classic Profile has been significantly improved upon by RSLogix 5000 drive Add-On Profiles (version 16 or later), it is highly recommended to use RSLogix 5000 drive Add-On Profiles to take advantage of its benefits (more intuitive, time saving, and less likely to make ladder logic program errors).

Creating Ladder Logic Using the RSLogix 5000 Generic Profile (all versions)

Drive and Adapter Parameter Settings

The following drive and adapter settings were used for the example ladder logic program in this section.

Device	Parameter	Value	Description
PowerFlex 70 EC Drive	90 - [Speed Ref A Sel]	22 (DPI Port 5)	Assigns 20-COMM-E to be used for the Reference.
	300 - [Data In A1]	140	Points to Par. 140 - [Accel Time 1]
	301 - [Data In A2]	142	Points to Par. 142 - [Decel Time 1]
	302 - [Data In B1]	100	Points to Par. 100 - [Jog Speed]
	303 - [Data In B2]	155	Points to Par. 155 - [Stop Mode A]
	304 - [Data In C1]	101	Points to Par. 101 - [Preset Speed 1]
	305 - [Data In C2]	102	Points to Par. 102 - [Preset Speed 2]
	306 - [Data In D1]	103	Points to Par. 103 - [Preset Speed 3]
	307 - [Data In D2]	104	Points to Par. 104 - [Preset Speed 4]
	310 - [Data Out A1]	140	Points to Par. 140 - [Accel Time 1]
	311 - [Data Out A2]	142	Points to Par. 142 - [Decel Time 1]
	312 - [Data Out B1]	100	Points to Par. 100 - [Jog Speed]
	313 - [Data Out B2]	155	Points to Par. 155 - [Stop Mode A]
	314 - [Data Out C1]	101	Points to Par. 101 - [Preset Speed 1]
	315 - [Data Out C2]	102	Points to Par. 102 - [Preset Speed 2]
	316 - [Data Out D1]	103	Points to Par. 103 - [Preset Speed 3]
	317 - [Data Out D2]	104	Points to Par. 104 - [Preset Speed 4]
PowerFlex 750-Series Drive (1)	545 - [Spd Ref A Sel]	Port 0: Port 6 Reference	Assigns 20-COMM-E to be used for the Reference.
	895 - [Data In A1]	Port 0: Accel Time 1	Points to Par. 535 in the drive.
	896 - [Data In A2]	Port 0: Testpoint Sel 1	Points to Par. 970 in the drive.
	897 - [Data In B1]	Port 5: Anlg Out1 Hi	Points to Par. 90 in Port 5 (I/O module).
	905 - [Data Out A1]	Port 0: DC Bus Volts	Points to Par. 11 in the drive.
	906 - [Data Out A2]	Port 0: Open Loop Fdbk	Points to Par. 137 in the drive.
	907 - [Data Out B1]	Port 5: Anlg Out0 Data	Points to Par. 77 in Port 5 (I/O module).
20-COMM-E Adapter	04 - [IP Addr Cfg 1] ⋮ 07 - [IP Addr Cfg 4]	10.91.100.79	IP address for the adapter.
	08 - [Subnet Cfg 1] ⋮ 11 - [Subnet Cfg 4]	255.255.248.0	Subnet mask for the adapter.
	23 - [DPI I/O Cfg]	xxx1 1111	Enables Cmd/Ref and Datalinks A…D.
	35 - [M-S Input]	xxx1 1111	Configures the I/O Data to be transferred from the controller on the network to the drive.
	36 - [M-S Output]	xxx1 1111	Configures the I/O Data to be transferred from the drive to the controller on the network.

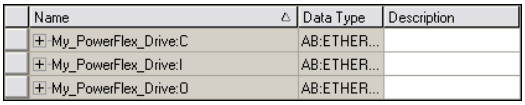
(1) In this example, the 20-COMM-E adapter/20-750-20COMM Option Card is installed in Port 6, and a 24V I/O module is installed in Port 5. Also, Data In B2…D2 (Parameters 898…902) and Data Out B2…D2 (Parameters 908…912) are enabled, but not used.

TIP: Data In parameters are inputs into the drive that come from controller outputs (for example, data to write to a drive parameter). Data Out parameters are outputs from the drive that go to controller inputs (for example, data to read a drive parameter).

Controller Tags

When you add the adapter and drive to the I/O configuration (Chapter 4), RSLogix 5000 automatically creates generic (non-descriptive) controller tags for them. In this example program, the following controller tags are used.

Figure 5.4 ControlLogix Controller Tags for Drive Generic Profile Example Ladder Logic Program



Name	Data Type	Description
My_PowerFlex_Drive:C	AB:ETHER...	
My_PowerFlex_Drive:I	AB:ETHER...	
My_PowerFlex_Drive:O	AB:ETHER...	

You can expand the Input and Output tags to reveal the input and output configuration.

PowerFlex 750-Series Drive

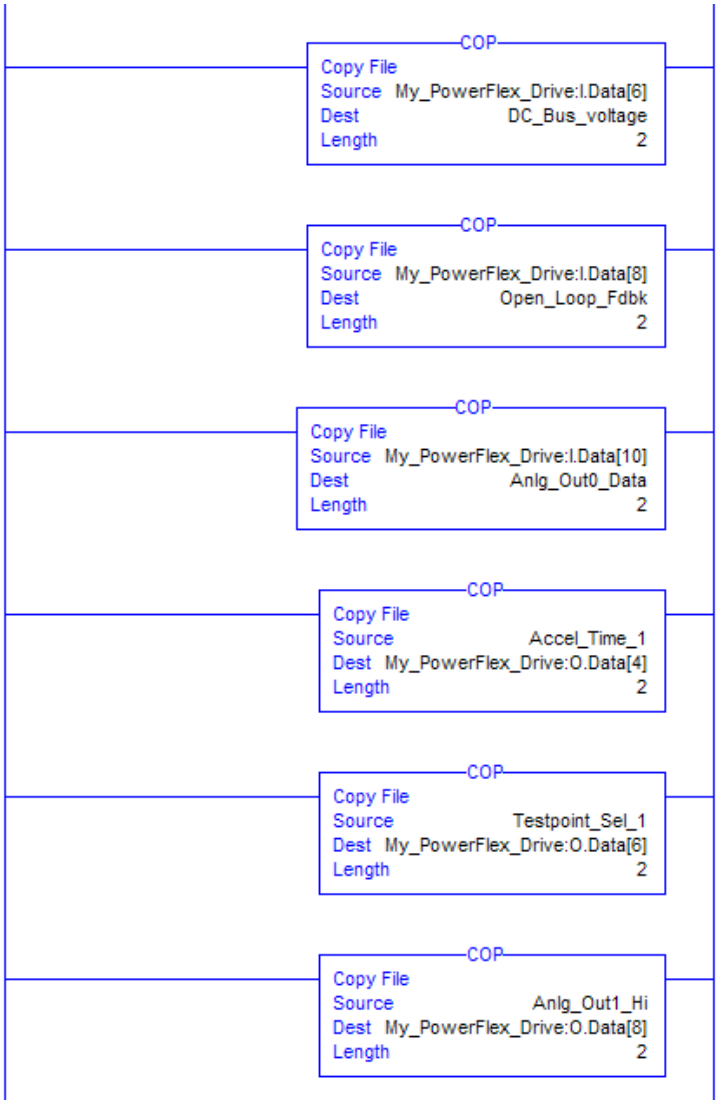
For PowerFlex 7-Class drives, the scaling may need to be multiplied by 10 or 100, depending on the parameter. For more information, see Datalink Scaling on page 5-7.

Figure 5.11 ControlLogix Example Ladder Logic Program Using a Drive Generic Profile for PowerFlex 750-Series Drives Datalink Scaling



For PowerFlex 750-Series drives, the destination tag can be a REAL or DINT. Make the destination tag the same data type as the parameter being read. For information on Datalink scaling, see page 5-8.

PLC-5, SLC 500 or MicroLogix 1100/1400 Example

Drive and Adapter Parameter Settings

The following drive and adapter settings were used for the example ladder logic program in this section.

Device	Parameter	Value	Description
PowerFlex 70 EC Drive	90 - [Speed Ref A Sel]	22 (DPI Port 5)	Assigns 20-COMM-E to be used for the Reference.
	300 - [Data In A1]	140	Points to Par. 140 - [Accel Time 1]
	301 - [Data In A2]	142	Points to Par. 142 - [Decel Time 1]
	302 - [Data In B1]	100	Points to Par. 100 - [Jog Speed]
	303 - [Data In B2]	155	Points to Par. 155 - [Stop Mode A]
	304 - [Data In C1]	101	Points to Par. 101 - [Preset Speed 1]
	305 - [Data In C2]	102	Points to Par. 102 - [Preset Speed 2]
	306 - [Data In D1]	103	Points to Par. 103 - [Preset Speed 3]
	307 - [Data In D2]	104	Points to Par. 104 - [Preset Speed 4]
	310 - [Data Out A1]	140	Points to Par. 140 - [Accel Time 1]
	311 - [Data Out A2]	142	Points to Par. 142 - [Decel Time 1]
	312 - [Data Out B1]	100	Points to Par. 100 - [Jog Speed]
	313 - [Data Out B2]	155	Points to Par. 155 - [Stop Mode A]
	314 - [Data Out C1]	101	Points to Par. 101 - [Preset Speed 1]
	315 - [Data Out C2]	102	Points to Par. 102 - [Preset Speed 2]
	316 - [Data Out D1]	103	Points to Par. 103 - [Preset Speed 3]
	317 - [Data Out D2]	104	Points to Par. 104 - [Preset Speed 4]
PowerFlex 750-Series Drive (1)	545 - [Spd Ref A Sel]	Port 0: Port 6 Reference	Assigns 20-COMM-E to be used for the Reference.
	895 - [Data In A1]	Port 0: Accel Time 1	Points to Par. 535 in the drive.
	896 - [Data In A2]	Port 0: Testpoint Sel 1	Points to Par. 970 in the drive.
	897 - [Data In B1]	Port 5: Anlg Out1 Hi	Points to Par. 90 in Port 5 (I/O module).
	905 - [Data Out A1]	Port 0: DC Bus Volts	Points to Par. 11 in the drive.
	906 - [Data Out A2]	Port 0: Open Loop Fdbk	Points to Par. 137 in the drive.
	907 - [Data Out B1]	Port 5: Anlg Out0 Data	Points to Par. 77 in Port 5 (I/O module).
20-COMM-E Adapter	04 - [IP Addr Cfg 1] ⋮ 07 - [IP Addr Cfg 4]	10.91.100.79	IP address for the adapter.
	08 - [Subnet Cfg 1] ⋮ 11 - [Subnet Cfg 4]	255.255.248.0	Subnet mask for the adapter.
	23 - [DPI I/O Cfg]	xxx1 1111	Enables Cmd/Ref and Datalinks A…D.
	35 - [M-S Input]	xxx1 1111	Configures the I/O Data to be transferred from the controller on the network to the drive.
	36 - [M-S Output]	xxx1 1111	Configures the I/O Data to be transferred from the drive to the controller on the network.

(1) In this example, the 20-COMM-E adapter/20-750-20COMM Option Card is installed in Port 6, and a 24V I/O module is installed in Port 5. Also, Data In B2…D2 (Parameters 898…902) and Data Out B2…D2 (Parameters 908…912) are enabled, but not used.

TIP: Data In parameters are inputs into the drive that come from controller outputs (for example, data to write to a drive parameter). Data Out parameters are outputs from the drive that go to controller inputs (for example, data to read a drive parameter).

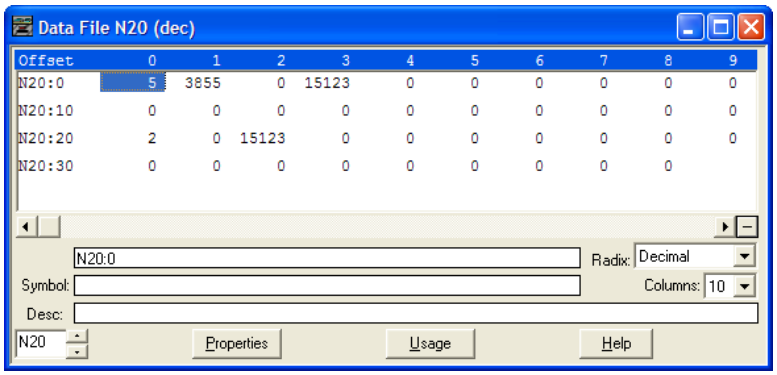
TIP: When using a drive that has 16-bit Datalinks (PowerFlex 70, PowerFlex 700, and PowerFlex 700H) to transfer a 32-bit parameter, two contiguous drive Datalink parameters (for example, Data Out A1/A2, B1/B2, etc.) are required. To determine if a parameter is a 32-bit parameter, see the Parameter section in the drive documentation and look for a 32 symbol in the "No." column. (All parameters in PowerFlex 700 Series B drives are 32-bit parameters.) For example, parameter 3 - [Output Current] in a PowerFlex 70 EC drive is a 32-bit parameter. When using a drive that has 32-bit Datalinks (PowerFlex 700 VC and PowerFlex 700S), only one drive Datalink parameter is required to transfer any parameter.

Understanding Controller Data Table Addresses

Since PLC-5, SLC 500, and MicroLogix 1100/1400 controllers are 16-bit platforms and are used with the 32-bit 20-COMM-E adapter, the data will be transposed from the least-significant word (LSW) to the most-significant word (MSW) in the controller.

When the I/O was configured (Chapter 4), an available data table address (N20:0) was used. Figure 5.12 shows the entire data file address structure for this example.

Figure 5.12 Data File Table for Example Ladder Logic Program



Important: The N20:0 data table address in this example is used to set a control timeout value (in seconds) which determines how long it will take the adapter to detect a communication loss. Enter a valid value (1…32767) for N20:0. A value of zero (0) is not valid, since it disables the timeout and all I/O connections (Logic Command/Status, Reference/Feedback, and Datalinks) intended for the drive will not execute. A timeout value of 5…20 seconds is recommended.

Depending on the drive you are using, Table 5.G, Table 5.H, Table 5.I, or Table 5.J show the I/O definitions as they relate to the N20:0 data table address (Figure 5.12) being used in this example.

When using PowerFlex 70 SC or 70 EC, PowerFlex 700 SC, PowerFlex 700H drives or SMC Flex, which all contain INT (16-bit format) data types, you will read from and write to the MSW data table address in the controller.

When using PowerFlex 700 VC drives, which contain DINT (32-bit format) data types, you will read from and write to the LSW data table address in the controller.

When using PowerFlex 700S and PowerFlex 750-Series drives, which contain both DINT (32-bit format) and REAL (floating point format) data types, you will always read from and write to the LSW data table address in the controller first. Then if the data value exceeds 16 bits, the remaining value will be in the MSW data table address.

Table 5.G Controller Data Table Addresses for PowerFlex 70 SC/EC, PowerFlex 700 SC, and PowerFlex 700H Drives, and SMC Flex

Data Table Address	Description
N20:1	Logic Status (see Appendix D)
N20:2	Reserved
N20:3	Speed Feedback
N20:4	Value of parameter assigned to Parameter 310 [Data Out A1] LSW
N20:5	Value of parameter assigned to Parameter 310 [Data Out A1] MSW
N20:6	Value of parameter assigned to Parameter 311 [Data Out A2] LSW
N20:7	Value of parameter assigned to Parameter 311 [Data Out A2] MSW
N20:8	Value of parameter assigned to Parameter 312 [Data Out B1] LSW
N20:9	Value of parameter assigned to Parameter 312 [Data Out B1] MSW
N20:10	Value of parameter assigned to Parameter 313 [Data Out B2] LSW
N20:11	Value of parameter assigned to Parameter 313 [Data Out B2] MSW
N20:12	Value of parameter assigned to Parameter 314 [Data Out C1] LSW
N20:13	Value of parameter assigned to Parameter 314 [Data Out C1] MSW
N20:14	Value of parameter assigned to Parameter 315 [Data Out C2] LSW
N20:15	Value of parameter assigned to Parameter 315 [Data Out C2] MSW
N20:16	Value of parameter assigned to Parameter 316 [Data Out D1] LSW
N20:17	Value of parameter assigned to Parameter 316 [Data Out D1] MSW
N20:18	Value of parameter assigned to Parameter 317 [Data Out D2] LSW
N20:19	Value of parameter assigned to Parameter 317 [Data Out D2] MSW
N20:20	Logic Command (see Appendix D)
N20:21	Reserved
N20:22	Speed Reference
N20:23	Value of parameter assigned to Parameter 300 [Data In A1] LSW
N20:24	Value of parameter assigned to Parameter 300 [Data In A1] MSW
N20:25	Value of parameter assigned to Parameter 301 [Data In A2] LSW
N20:26	Value of parameter assigned to Parameter 301 [Data In A2] MSW
N20:27	Value of parameter assigned to Parameter 302 [Data In B1] LSW
N20:28	Value of parameter assigned to Parameter 302 [Data In B1] MSW
N20:29	Value of parameter assigned to Parameter 303 [Data In B2] LSW
N20:30	Value of parameter assigned to Parameter 303 [Data In B2] MSW
N20:31	Value of parameter assigned to Parameter 304 [Data In C1] LSW
N20:32	Value of parameter assigned to Parameter 304 [Data In C1] MSW
N20:33	Value of parameter assigned to Parameter 305 [Data In C2] LSW
N20:34	Value of parameter assigned to Parameter 305 [Data In C2] MSW
N20:35	Value of parameter assigned to Parameter 306 [Data In D1] LSW

N20:35	Value of parameter assigned to Parameter 901 [Data In D1] LSW
N20:36	Value of parameter assigned to Parameter 901 [Data In D1] MSW
N20:37	Value of parameter assigned to Parameter 902 [Data In D2] LSW
N20:38	Value of parameter assigned to Parameter 902 [Data In D2] MSW

You can use the controller data table addresses to directly control and monitor the drive without creating any ladder logic program. However, if you intend to use Human Machine Interface devices (PanelView, etc.) to operate the drive and view its status, you will need to create descriptive controller data table addresses (Table 5.L and Table 5.M) and a ladder logic program that will pass that data to the data table addresses used for messaging.

Table 5.L Controller and Program Data Table Address Descriptions for Example Logic Status/Feedback Ladder Logic Program

Description	Controller Data Table Address
Drive Ready	N20:1/0
Drive Active	N20:1/1
Actual Direction (XIO)	N20:1/3
Actual Direction (XIC)	N20:1/3
Drive Faulted	N20:1/7
Drive At Speed	N20:1/8
Speed Feedback	N20:3

Description	Program Data Table Address
Status Ready	B3:1/0
Status Active	B3:1/1
Status Forward	B3:1/3
Status Reverse	B3:1/4
Status Faulted	B3:1/7
Status At Speed	B3:1/8
Speed Feedback	B30:3

Table 5.M Program and Controller Data Table Address Descriptions for Example Logic Command/Reference Ladder Logic Program

Description	Program Data Table Address
Command Stop	B3:20/0
Command Start	B3:20/1
Command Jog	B3:20/2
Command Clear Faults	B3:20/3
Command Forward Reverse (XIO)	B3:20/4
Command Forward Reverse (XIC)	B3:20/4
Speed Reference	N30:22

Description	Controller Data Table Address
Drive Stop	N20:20/0
Drive Start	N20:20/1
Drive Jog	N20:20/2
Drive Clear Faults	N20:20/3
Drive Forward	N20:20/4
Drive Reverse	N20:20/5
Speed Reference	N20:22

An example ladder logic program that uses these descriptive controller data table addresses and passes their data to the descriptive program data table addresses is shown in Figure 5.13, Figure 5.14, Figure 5.15, and Figure 5.16.

PowerFlex 750-Series Drive Speed Reference

Notes:

Using Explicit Messaging

This chapter provides information and examples that explain how to use Explicit Messaging to configure and monitor the adapter and connected PowerFlex 7-Class drive or PowerFlex 750-Series drive.

Important: When used in a PowerFlex 750-Series drive, the 20-COMM-E adapter must have firmware version 4.001 (or later) to support explicit messaging to drive parameters (Port 0). Furthermore, the adapter requires firmware version 4.002 (or later) for explicit messaging to parameters of peripherals in drive Ports 1…14.

Topic	Page
About Explicit Messaging	6-2
Performing Explicit Messages	6-3
ControlLogix Examples	6-4
PLC-5 Examples	6-23
SLC 500 Examples	6-29
MicroLogix 1100/1400 Examples	6-53

ATTENTION: Risk of injury or equipment damage exists. The examples in this publication are intended solely for purposes of example. There are many variables and requirements with any application. Rockwell Automation, Inc. does not assume responsibility or liability (to include intellectual property liability) for actual use of the examples shown in this publication.

ATTENTION: Risk of equipment damage exists. If Explicit Messages are programmed to write parameter data to Non-Volatile Storage (NVS) frequently, the NVS will quickly exceed its life cycle and cause the drive to malfunction. Do not create a program that frequently uses Explicit Messages to write parameter data to NVS. Datalinks do not write to NVS and should be used for frequently changed parameters.

Refer to Chapter 5 for information about the I/O Image, using Logic Command/Status, Reference/Feedback, and Datalinks.

About Explicit Messaging

Explicit Messaging is used to transfer data that does not require continuous updates. With Explicit Messaging, you can configure and monitor a slave device's parameters on the network.

Important: When an explicit message is performed, by default no connection is made since it is an "unconnected" message. When timing of the message transaction is important, you can create a dedicated message connection between the controller and drive by checking the "Connected" box on the Communications tab message configuration screen during message setup. These message connections are in addition to the I/O connection. However, the trade off for more message connections is decreased network performance. If your application cannot tolerate this, do not check the "Connected" box, which is recommended.

Important: PowerFlex 7-Class and PowerFlex 750-Series drives have explicit messaging limitations. Table 6.A shows the EtherNet/IP Object Class code compatibilities for these drives.

Table 6.A Explicit Messaging Class Code Compatibility with Drives

EtherNet/IP Object Class Code	PowerFlex 7-Class Drives	PowerFlex 750-Series Drives	Explicit Messaging Function
Parameter Object 0x0F	Yes	No	Single parameter reads/writes
DPI Parameter Object 0x93	Yes	Yes(1) with limitations	Single and scattered parameter reads/writes
Host DPI Parameter Object 0x9F	No	Yes(2) with limitations	Single and scattered parameter reads/writes

(1) Enables access to drive parameters (Port 0), DPI device parameters (Ports 1…6 only), and Host parameters (Ports 7…14 only). For example, DPI Parameter Object Class code 0x93 can access a 20-COMM-E adapter in Port 6. However, Class code 0x93 cannot access, for example, the Host parameters in a 24V I/O option module in Port 5. See DPI Parameter Object on page C-16 for instance (parameter) numbering.

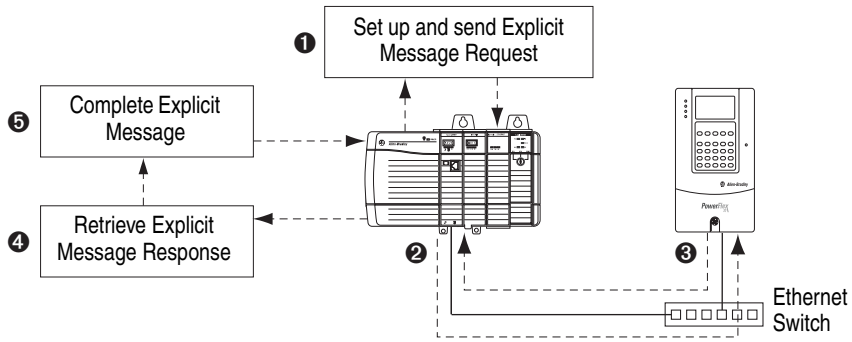
(2) Enables access to drive parameters (Port 0) and Host parameters for all ports (1…14). Host DPI Parameter Object Class code 0x9F cannot access DPI (device) parameters. For example, if a 20-750-DNET option module is in Port 4, its Host parameters can be accessed, but not its DPI (device) parameters. See Host DPI Parameter Object on page C-30 for instance (parameter) numbering.

Performing Explicit Messages

There are five basic events in the Explicit Messaging process. The details of each step will vary depending on the type of controller being used. Refer to the documentation for your controller.

Important: There must be a request message and a response message for all Explicit Messages, whether you are reading or writing data.

Figure 6.1 Explicit Message Process



Event	Description
❶	You format the required data and set up the ladder logic program to send an Explicit Message request to the scanner or bridge module (download).
❷	The scanner or bridge module transmits the Explicit Message Request to the slave device over the network.
❸	The slave device transmits the Explicit Message Response back to the scanner. The data is stored in the scanner buffer.
❹	The controller retrieves the Explicit Message Response from the scanner's buffer (upload).
❺	The Explicit Message is complete.

For information on the maximum number of Explicit Messages that can be executed at a time, refer to the user manual for the scanner or bridge and/or controller that is being used.

ControlLogix Examples

TIP: To display the Message Configuration screen in RSLogix 5000, add a message instruction (MSG), create a new tag for the message (Properties: Base tag type, MESSAGE data type, controller scope), and click the ... button in the message instruction.

For supported classes, instances, and attributes, refer to Appendix C, EtherNet/IP Objects.

Explicit Messaging Using RSLogix 5000 Version 15 (or later)

ControlLogix Example Ladder Logic Program to Read a Single Parameter

A Parameter Read message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter read, follow the RSLogix 5000 (all versions) single read example on page 6-19.

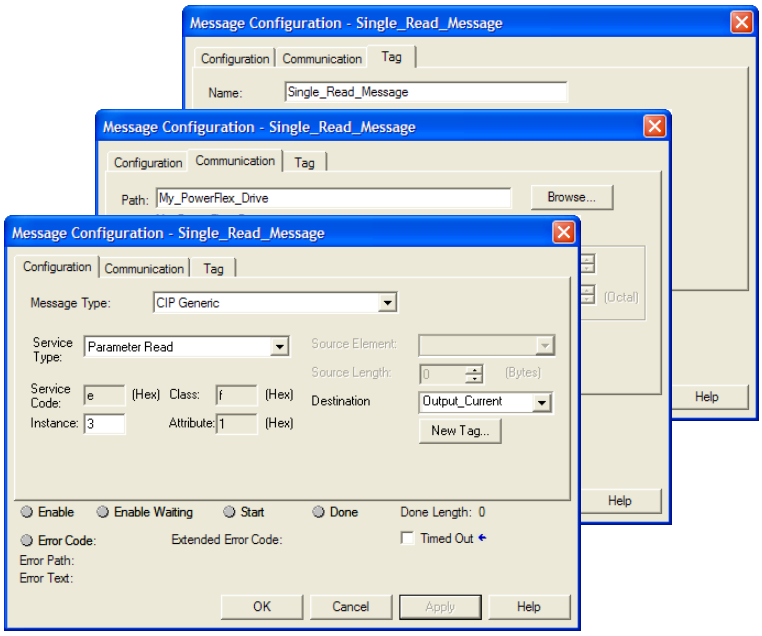
Table 6.B Example Controller Tags to Read a Single Parameter

Operand	Controller Tags for Single Read Message	Data Type
XIC	Execute_Single_Read_Message	BOOL
MSG	Single_Read_Message	MESSAGE

Figure 6.2 Example Ladder Logic to Read a Single Parameter

ControlLogix – Formatting a Message to Read a Single Parameter (version 15 or later)

Figure 6.3 Parameter Read Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access the Parameter Object in the adapter.
Service Type [1]	Parameter Read	This service is used to read a parameter value.
Service Code [1]	e (Hex.)	Code for the requested service.
Class	f (Hex.)	Class ID for the DPI Parameter Object.
Instance [2]	3 (Dec.)	Instance number is the same as parameter number.
Attribute	1 (Hex.)	Attribute number for the Parameter Value attribute.
Destination	Output_Current [4]	The tag where the data that is read is stored.
Communication Tab	**Example Value**	**Description**
Path [3]	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Single_Read_Message	The name for the message.

[1] The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

[2] Only drive parameters (Port 0) can be read using Parameter Object Class code 0x0F. To read a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-19).

[3] Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

[4] In this example, Output Current is a 32-bit parameter requiring the Data Type field to be set to “DINT” when creating the controller tag. If the parameter being read is a 16-bit parameter, the tag Data Type field must be set to “INT.” When using a PowerFlex 700S drive, Output Current is a floating point parameter requiring the Data Type field to be set to “REAL” when creating the controller tag. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

ControlLogix Example Ladder Logic Program to Write a Single Parameter (version 15 or later)

A Parameter Write message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter write, follow the RSLogix 5000 (all versions) single write example on page 6-21.

Table 6.C Example Controller Tags to Write a Single Parameter

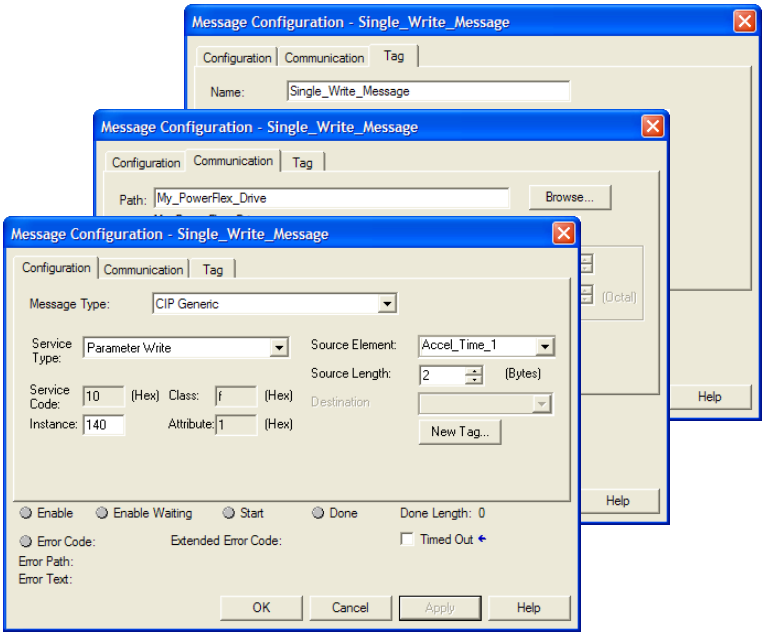
Operand	Controller Tags for Single Write Message	Data Type
XIC	Execute_Single_Write_Message	BOOL
MSG	Single_Write_Message	MESSAGE

Figure 6.4 Example Ladder Logic to Write a Single Parameter

Important: If the explicit message single write must be written continuously, use DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F and attribute A (10 decimal; see page 6-22). This writes to RAM—not NVS (EEPROM) memory. This example single write message using Class code F writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

ControlLogix – Formatting a Message to Write a Single Parameter (version 15 or later)

Figure 6.5 Parameter Write Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access the Parameter Object in the adapter.
Service Type (1)	Parameter Write	This service is used to write a parameter value.
Service Code (1)	10 (Hex.)	Code for the requested service.
Class	f (Hex.)	Class ID for the DPI Parameter Object.
Instance (2)	140 (Dec.)	Instance number is the same as parameter number.
Attribute	1 (Hex.)	Attribute number for the Parameter Value attribute.
Source Element	Accel_Time_1 (4)	Name of the tag for any service data to be sent from the scanner or bridge to the adapter/drive.
Source Length	2 (4)	Number of bytes of service data to be sent in the message.
Communication Tab	**Example Value**	**Description**
Path (3)	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Single_Write_Message	The name for the message.

(1) The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Only drive parameters (Port 0) can be written to using Parameter Object Class code 0x0F. To write to a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-21).

(3) Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

(4) In this example, Accel Time 1 is a 16-bit parameter requiring the tag Data Type field to be set to “INT” when creating the controller tag. If the parameter being written to is a 32-bit parameter, the tag Data Type field must be set to “DINT.” Also, the Source Length field on the Message Configuration screen must correspond to the selected Data Type in bytes (for example, 4 bytes for a DINT or a REAL). When using a PowerFlex 700S drive, Accel Time 1 is a floating point number requiring the Data Type field to be set to “REAL” when creating the controller tag. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

ControlLogix Example Ladder Logic Program to Read Multiple Parameters (all versions)

A Scattered Read message is used to read the values of multiple parameters. Up to 22 parameters can be read. This read message example reads the values of these five parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

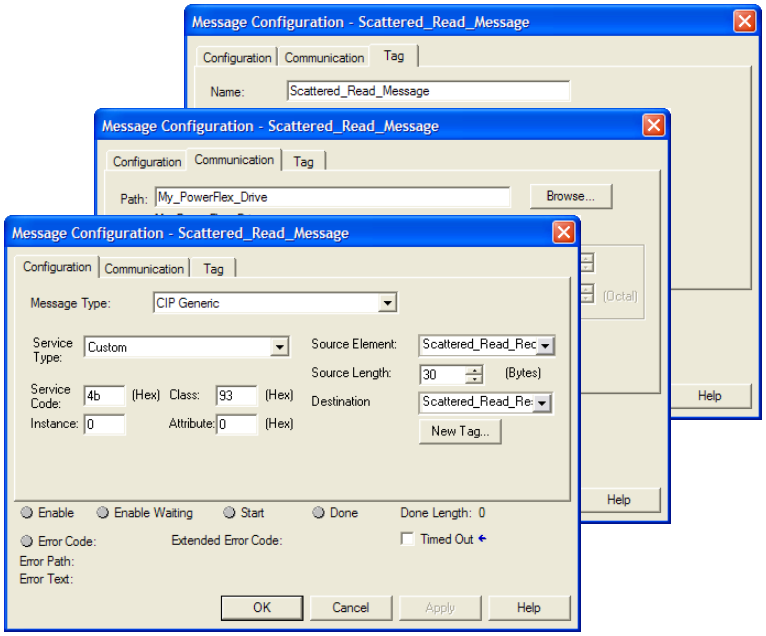
Table 6.D Example Controller Tags to Read Multiple Parameters

Operand	Controller Tags for Read Multiple Message	Data Type
XIC	Execute_Scattered_Read_Message	BOOL
MSG	Scattered_Read_Message	MESSAGE

Figure 6.6 Example Ladder Logic to Read Multiple Parameters

ControlLogix – Formatting a Message to Read Multiple Parameters (all versions)

Figure 6.7 Scattered Read Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read multiple parameters.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access Parameter Object in the adapter.
Service Type (1)	Custom	Required for scattered messages.
Service Code (1)	4b (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Hex.)	Required for scattered messages.
Source Element	Scattered_Read_Request (4)	Name of the tag for any service data to be sent from scanner or bridge to the adapter/drive.
Source Length	30 (4)	Number of bytes of service data to be sent in the message.
Destination	Scattered_Read_Response	The tag where the data that is read is stored.
Communication Tab	**Example Value**	**Description**
Path (2)	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Scattered_Read_Message	The name for the message.

(1) The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

(4) In this example, we are reading five parameters. Each parameter being read requires an array of three INT registers. Therefore, a controller tag was created with its Data Type field set to “INT[15].” Also, the Source Length field on the Message Configuration screen must correspond to the selected Data Type in bytes (for this example, 30 bytes for an INT[15] array). Scattered read messages always assume that every parameter being read is a 32-bit parameter, regardless of its actual size. Maximum length is 132 bytes or 66 words which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

ControlLogix Example Scattered Read Request Data

In this message example, we use the data structure in Figure 6.8 or Figure 6.9 in the source tag named Scattered_Read_Request to read these five parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.8 Example Scattered Read Request Data for PowerFlex 7-Class Drive

Name	Value	Data Type	Description
Scattered_Read_Request	{...}	INT[15]	
Scattered_Read_Request[0]	1	INT	Parameter Number (decimal)

Scattered_Read_Request[10]	0	INT	Pad Word
Scattered_Read_Request[11]	0	INT	Pad Word
Scattered_Read_Request[12]	260	INT	Parameter Number (decimal)
Scattered_Read_Request[13]	0	INT	Pad Word
Scattered_Read_Request[14]	0	INT	Pad Word

ControlLogix Example Scattered Read Response Data

The Scattered Read Request message reads the multiple parameters and returns their values to the destination tag (Scattered_Read_Response). Figure 6.10 or Figure 6.11 shows the parameter values.

Figure 6.10 Example Scattered Read Response Data for PowerFlex 7-Class Drive

Name	Value	Data Type	Description
Scattered_Read_Response	{...}	INT[15]	
Scattered_Read_Response[0]	1	INT	Parameter Number (decimal)
Scattered_Read_Response[1]	325	INT	Parameter Value LSW
Scattered_Read_Response[2]	0	INT	Parameter Value MSW
Scattered_Read_Response[3]	3	INT	Parameter Number (decimal)
Scattered_Read_Response[4]	1	INT	Parameter Value LSW
Scattered_Read_Response[5]	0	INT	Parameter Value MSW
Scattered_Read_Response[6]	6	INT	Parameter Number (decimal)
Scattered_Read_Response[7]	1187	INT	Parameter Value LSW
Scattered_Read_Response[8]	0	INT	Parameter Value MSW
Scattered_Read_Response[9]	12	INT	Parameter Number (decimal)
Scattered_Read_Response[10]	3292	INT	Parameter Value LSW
Scattered_Read_Response[11]	0	INT	Parameter Value MSW
Scattered_Read_Response[12]	17	INT	Parameter Number (decimal)
Scattered_Read_Response[13]	8318	INT	Parameter Value LSW
Scattered_Read_Response[14]	0	INT	Parameter Value MSW

In this message example, the parameters have the following values:

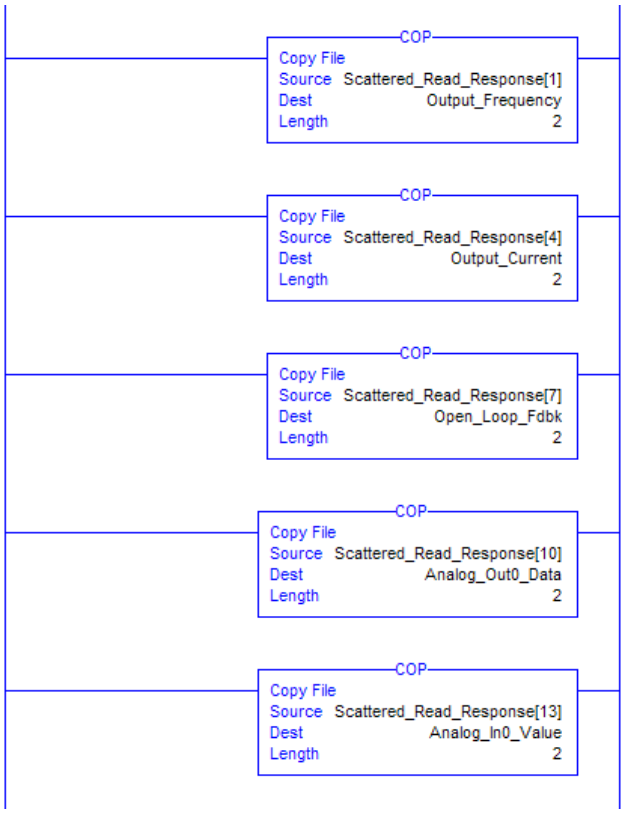
PowerFlex 7-Class Drive Parameter	Read Value
1 - [Output Freq]	32.5 Hz
3 - [Output Current]	0.01 Amp
6 - [Output Voltage]	118.7 VAC
12 - [DC Bus Voltage]	329.2 VDC
17 - [Analog In2 Value]	8.318 mA

Figure 6.11 Example Scattered Read Response Data for PowerFlex 750-Series Drive

Name	Value	Data Type	Description
Scattered_Read_Response	{...}	INT[15]	
Scattered_Read_Response[0]	1	INT	Parameter Number (decimal)
Scattered_Read_Response[1]	0	INT	Parameter Value LSW
Scattered_Read_Response[2]	16948	INT	Parameter Value MSW
Scattered_Read_Response[3]	7	INT	Parameter Number (decimal)
Scattered_Read_Response[4]	-15729	INT	Parameter Value LSW
Scattered_Read_Response[5]	15605	INT	Parameter Value MSW
Scattered_Read_Response[6]	137	INT	Parameter Number (decimal)
Scattered_Read_Response[7]	23698	INT	Parameter Value LSW
Scattered_Read_Response[8]	26035	INT	Parameter Value MSW
Scattered_Read_Response[9]	21581	INT	Parameter Number (decimal)
Scattered_Read_Response[10]	0	INT	Parameter Value LSW
Scattered_Read_Response[11]	16948	INT	Parameter Value MSW
Scattered_Read_Response[12]	260	INT	Parameter Number (decimal)
Scattered_Read_Response[13]	-9437	INT	Parameter Value LSW
Scattered_Read_Response[14]	16661	INT	Parameter Value MSW

The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP command must be used to copy the Scattered_Read_Response integer array to a 32-bit integer or REAL tag. Figure 6.12 shows the ladder logic used for this example. If the parameter data type is a REAL, then the destination tag is a REAL. If the parameter data type is a 32-bit integer, then the destination tag is a DINT. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.12 Example Ladder Logic to Copy Response Data for PowerFlex 750-Series Drive



In this message example, the parameters have the following values:

PowerFlex 750-Series Drive Parameter	Read Value	Data Type
1 - [Output Freq]	45.0 Hz	REAL
7 - [Output Current]	0.03 Amp	REAL
137 - [Open Loop Fdbk]	1706253458	DINT
21581 - [Port 5: Analog Out 0 Data]	45.0 Hz	REAL
260 - [Analog In0 Value]	9.366 Volts	REAL

ControlLogix Example Ladder Logic Program to Write Multiple Parameters (all versions)

A Scattered Write message is used to write to multiple parameters. This write message example writes the following values to these five parameters:

PowerFlex 7-Class Drive Parameter	Write Value
141 - [Accel Time 2]	11.1 Sec.
143 - [Decel Time 2]	22.2 Sec.
105 - [Preset Speed 5]	33.3 Hz.
106 - [Preset Speed 6]	44.4 Hz.
107 - [Preset Speed 7]	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value
536 - [Accel Time 2]	11.1 Sec.
538 - [Decel Time 2]	22.2 Sec.
725 - [Zero Position]	33
21555 - [Port 5: Analog In0 Hi]	5.5
780 - [PTP Setpoint]	-75,555

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Table 6.E Example Controller Tags to Write Multiple Parameters

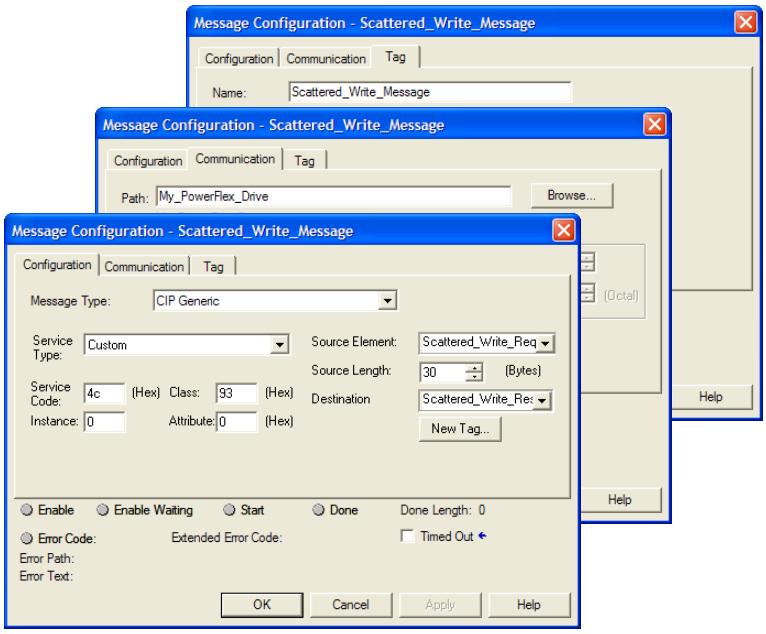
Operand	Controller Tags for Write Multiple Message	Data Type
XIC	Execute_Scattered_Write_Message	BOOL
MSG	Scattered_Write_Message	MESSAGE

Figure 6.13 Example Ladder Logic to Write Multiple Parameters

Important: If the explicit message scattered write must be written continuously, then use a separate explicit message single write for each parameter using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F and attribute A (10 decimal; see page 6-22). Attribute A writes to RAM—not NVS (EEPROM) memory. This example scattered write message using attribute 0 writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

ControlLogix – Formatting a Message to Write Multiple Parameters (all versions)

Figure 6.14 Scattered Write Multiple Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write multiple parameters.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access Parameter Object in the adapter.
Service Type (1)	Custom	Required for scattered messages.
Service Code (1)	4c (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Hex.)	Required for scattered messages.
Source Element	Scattered_Write_Request (4)	Name of the tag for any service data to be sent from scanner or bridge to the adapter/drive.
Source Length	30 (4)	Number of bytes of service data to be sent in the message.
Destination	Scattered_Write_Response	The tag where the data that is read is stored.
Communication Tab	**Example Value**	**Description**
Path (2)	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Scattered_Write_Message	The name for the message.

(1) The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

(4) In this example, we are writing to five parameters. Each parameter being written to requires an array of three INT registers. Therefore, a controller tag was created with its Data Type field set to “INT[15].” Also, the Source Length field on the Message Configuration screen must correspond to the selected Data Type in bytes (for this example, 30 bytes for an INT[15] array). Scattered write messages always assume that every parameter being written to is a 32-bit parameter, regardless of its actual size. Maximum length is 132 bytes or 66 words which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

ControlLogix Example Scattered Write Request Data

In this message example, we use the data structure in Figure 6.15 or Figure 6.18 in the source tag (Scattered_Write_Request) to write new values to these parameters:

PowerFlex 7-Class Drive Parameter	Write Value
141 - [Accel Time 2]	11.1 Sec.
143 - [Decel Time 2]	22.2 Sec.
105 - [Preset Speed 5]	33.3 Hz.
106 - [Preset Speed 6]	44.4 Hz.
107 - [Preset Speed 7]	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value	Data Type
536 - [Accel Time 2]	11.1 Sec.	REAL
538 - [Decel Time 2]	22.2 Sec.	REAL
725 - [Zero Position]	33	DINT
21555 - [Port 5: Analog In0 Hi]	5.5	REAL
780 - [PTP Setpoint]	-75,555	REAL

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.15 or Figure 6.18 shows the parameter values.

Figure 6.15 Example Scattered Write Request Data for PowerFlex 7-Class Drive

Name	Value	Data Type	Description
Scattered_Write_Request	{...}	INT[15]	
Scattered_Write_Request[0]	141	INT	Parameter Number (decimal)
Scattered_Write_Request[1]	111	INT	Parameter Value LSW
Scattered_Write_Request[2]	0	INT	Parameter Value MSW
Scattered_Write_Request[3]	143	INT	Parameter Number (decimal)
Scattered_Write_Request[4]	222	INT	Parameter Value LSW
Scattered_Write_Request[5]	0	INT	Parameter Value MSW
Scattered_Write_Request[6]	105	INT	Parameter Number (decimal)
Scattered_Write_Request[7]	333	INT	Parameter Value LSW
Scattered_Write_Request[8]	0	INT	Parameter Value MSW
Scattered_Write_Request[9]	106	INT	Parameter Number (decimal)
Scattered_Write_Request[10]	444	INT	Parameter Value LSW
Scattered_Write_Request[11]	0	INT	Parameter Value MSW
Scattered_Write_Request[12]	107	INT	Parameter Number (decimal)
Scattered_Write_Request[13]	555	INT	Parameter Value LSW
Scattered_Write_Request[14]	0	INT	Parameter Value MSW

ControlLogix Example Scattered Write Response Data

The results of the message appear in the destination tag named Scattered_Write_Response (Figure 6.16). Values of “0” indicate no errors occurred.

Figure 6.16 Example Scattered Write Response Data for PowerFlex 7-Class Drive

Name	Value	Data Type	Description
Scattered_Write_Response	{...}	INT[15]	
Scattered_Write_Response[0]	141	INT	Parameter Number (decimal)
Scattered_Write_Response[1]	0	INT	Pad Word or Error Code
Scattered_Write_Response[2]	0	INT	Pad Word
Scattered_Write_Response[3]	143	INT	Parameter Number (decimal)
Scattered_Write_Response[4]	0	INT	Pad Word or Error Code
Scattered_Write_Response[5]	0	INT	Pad Word
Scattered_Write_Response[6]	105	INT	Parameter Number (decimal)
Scattered_Write_Response[7]	0	INT	Pad Word or Error Code
Scattered_Write_Response[8]	0	INT	Pad Word
Scattered_Write_Response[9]	106	INT	Parameter Number (decimal)
Scattered_Write_Response[10]	0	INT	Pad Word or Error Code
Scattered_Write_Response[11]	0	INT	Pad Word
Scattered_Write_Response[12]	107	INT	Parameter Number (decimal)
Scattered_Write_Response[13]	0	INT	Pad Word or Error Code
Scattered_Write_Response[14]	0	INT	Pad Word

The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP command must be used to copy the 32-bit integer and REAL values to the Scattered_Write_Request integer array. Figure 6.17 shows the ladder logic used for this example. If the parameter data type is a REAL, then the source tag is a REAL. If the parameter data type is a 32-bit integer, then the source tag is a DINT. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.17 Example Ladder Logic to Copy Request Data for PowerFlex 750-Series Drive

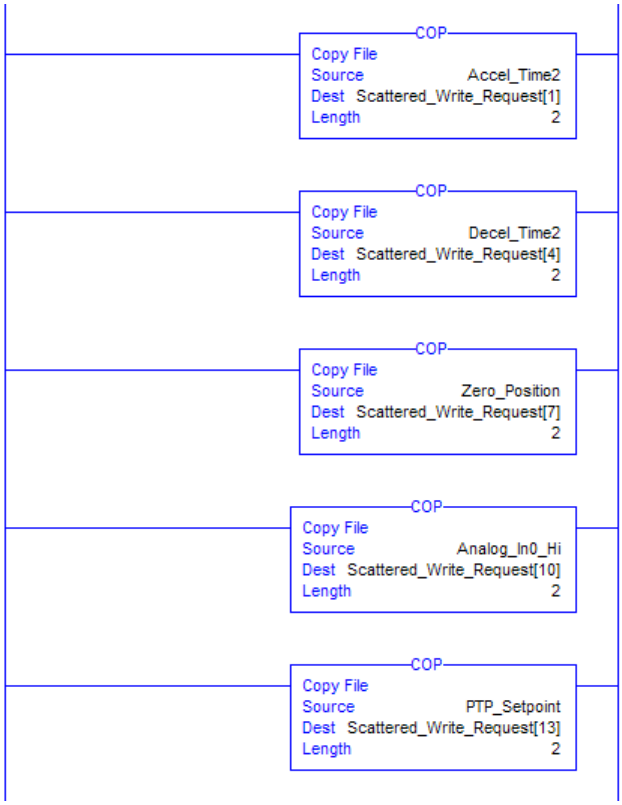


Figure 6.18 Example Scattered Write Request Data for PowerFlex 750-Series Drive

Name	Value	Data Type	Description
Scattered_Write_Request	{...}	INT[15]	
Scattered_Write_Request[0]	536	INT	Parameter Number (decimal)
Scattered_Write_Request[1]	-26214	INT	Parameter Value LSW
Scattered_Write_Request[2]	16689	INT	Parameter Value MSW
Scattered_Write_Request[3]	538	INT	Parameter Number (decimal)
Scattered_Write_Request[4]	-26214	INT	Parameter Value LSW
Scattered_Write_Request[5]	16817	INT	Parameter Value MSW
Scattered_Write_Request[6]	725	INT	Parameter Number (decimal)

ControlLogix – Explanation of Request and Response Data for Read/Write Multiple Messaging (all versions)

The data structures in Figure 6.20 and Figure 6.21 use 16-bit words and can accommodate up to 22 parameters in a single message. In the Response Message, a parameter number with the high bit set indicates that the associated parameter value field contains an error code (parameter number in response data will be negative).

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.20 Data Structures for Scattered Read Messages

	Request (Source Data)		Response (Destination Data)
Word 0	Parameter Number	Word 0	Parameter Number

Explicit Messaging Using RSLogix 5000 (all versions)

ControlLogix Example Ladder Logic Program to Read a Single Parameter

A Get Attribute Single message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

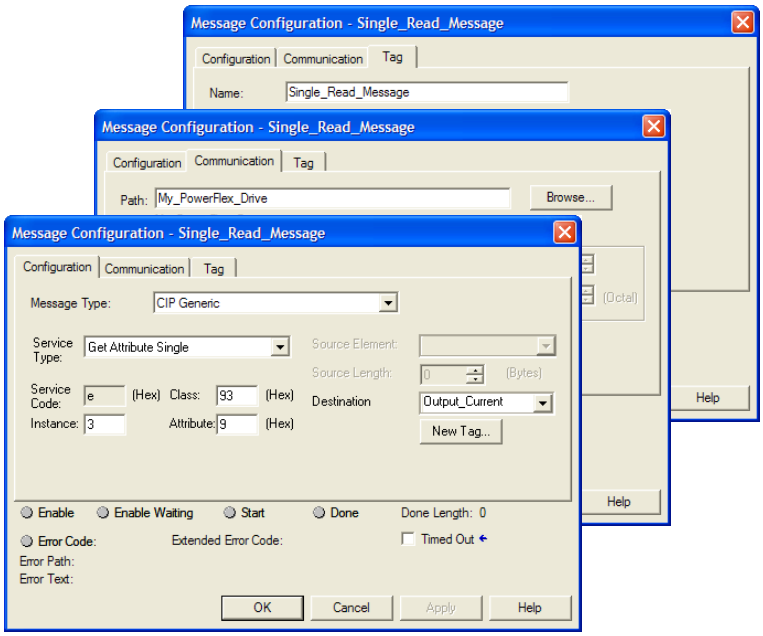
Table 6.F Example Controller Tags to Read a Single Parameter

Operand	Controller Tags for Single Read Message	Data Type
XIC	Execute_Single_Read_Message	BOOL
MSG	Single_Read_Message	MESSAGE

Figure 6.22 Example Ladder Logic to Read a Single Parameter

ControlLogix – Formatting a Message to Read a Single Parameter (all versions)

Figure 6.23 Get Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access the Parameter Object in the adapter.
Service Type [1]	Get Attribute Single	This service is used to read a parameter value.
Service Code [1]	e (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) [4]	Class ID for the DPI Parameter Object.
Instance [2]	3 (Dec.)	Instance number is the same as parameter number.
Attribute	9 (Hex.)	Attribute number for the Parameter Value attribute.
Destination	Output_Current [5]	The tag where the data that is read is stored.
Communication Tab	**Example Value**	**Description**
Path [3]	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Single_Read_Message	The name for the message.

[1] The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

[2] The instance is the parameter number in the drive (Port 0). For example, to read parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

[3] Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

[4] See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

[5] In this example, Output Current is a 32-bit parameter requiring the Data Type field to be set to “DINT” when creating the controller tag. If the parameter being read is a 16-bit parameter, the tag Data Type field must be set to “INT.” When using a PowerFlex 700S or PowerFlex 750-Series drive, Output Current is a floating point number requiring the Data Type field to be set to “REAL” when the creating controller tag. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

ControlLogix Example Ladder Logic Program to Write a Single Parameter (all versions)

A Set Attribute Single message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

Table 6.G Example Controller Tags to Write a Single Parameter

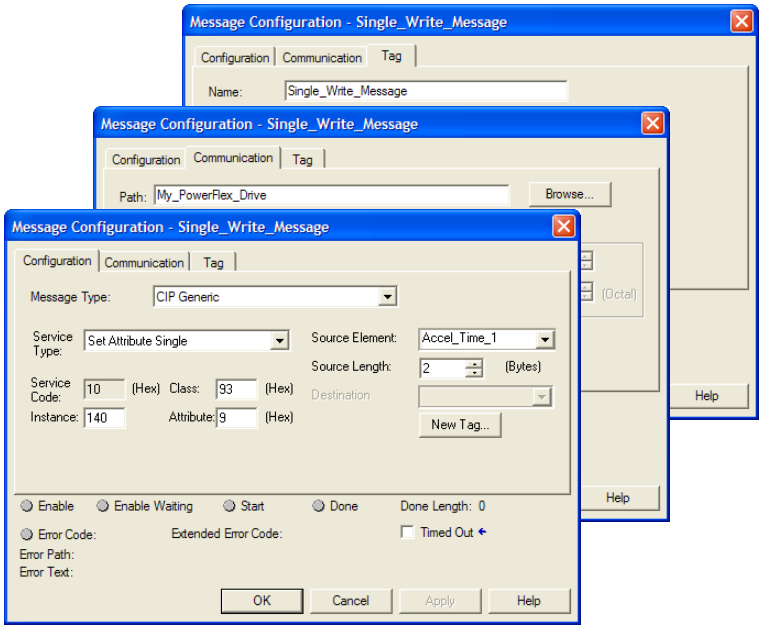
Operand	Controller Tags for Single Write Message	Data Type
XIC	Execute_Single_Write_Message	BOOL
MSG	Single_Write_Message	MESSAGE

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object 0x9F for explicit messaging.

Figure 6.24 Example Ladder Logic to Write a Single Parameter

ControlLogix – Formatting a Message to Write a Single Parameter (all versions)

Figure 6.25 Set Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

Configuration Tab	Example Value	Description
Message Type	CIP Generic	Used to access the Parameter Object in the adapter.
Service Type (1)	Set Attribute Single	This service is used to write a parameter value.
Service Code (1)	10 (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (5)	Class ID for the DPI Parameter Object.
Instance (2)	140 (Dec.)	Instance number is the same as parameter number.
Attribute (3)	9 or A (Hex.)	Attribute number for the Parameter Value attribute.
Source Element	Accel_Time_1 (6)	Name of the tag for any service data to be sent from the scanner or bridge to the adapter/drive.
Source Length	2 (6)	Number of bytes of service data to be sent in the message.
Communication Tab	**Example Value**	**Description**
Path (4)	My_PowerFlex_Drive	The path is the route that the message will follow.
Tag Tab	**Example Value**	**Description**
Name	Single_Write_Message	The name for the message.

(1) The default setting for Service Type is “Custom,” enabling entry of a Service Code not available from the Service Type pull-down menu. When choosing a Service Type other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) The instance is the parameter number in the drive (Port 0). For example, to write to parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

(3) Setting the Attribute value to “9” will write the parameter value to the drive’s Non-Volatile Storage (EEPROM) memory, so the parameter value will remain even after the drive is power cycled. **Important:** When set to “9,” be very cautious as the EEPROM may quickly exceed its life cycle and cause the drive to malfunction. Setting the Attribute value to “A” (10 decimal) will write the parameter value to temporary memory, so the parameter value will be lost after the drive is power cycled. It is recommended to use the “A” (10 decimal) setting when frequent write messages are required.

(4) Click **Browse** to find the path, or type in the name of the device listed in the I/O Configuration folder.

(5) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

(6) In this example, Accel Time 1 is a 16-bit parameter requiring the tag Data Type field to be set to “INT” when creating the controller tag. If the parameter being written to is a 32-bit parameter, the tag Data Type field must be set to “DINT.” Also, the Source Length field on the Message Configuration screen must correspond to the selected Data Type in bytes (for example, 4 bytes for a DINT or a REAL). When using a PowerFlex 700S or PowerFlex 750-Series drive, Accel Time 1 is a floating point number requiring the Data Type field to be set to “REAL” when creating the controller tag. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

ControlLogix Example Ladder Logic Program to Read or Write Multiple Parameters (all versions)

Since the example ladder logic rungs, configuration screens, and request/response data to read or write multiple parameters using RSLogix 5000 (all versions) are identical to those for RSLogix 5000 version 15 (or later), please refer to the information contained on page 6-8 through page 6-18 for complete details.

PLC-5 Examples

Important: The PLC-5 must be Series E (Rev. D.1 or later) to support the MultiHop feature that routes messaging to the drive.

Important: Due to inherent limitations with the PCCC N-File method, only contiguous multiple parameters can be read or written using explicit messaging.

For this explicit message example, we use the N150 N-Files because they are already mapped to specific parameters in the drive and its connected peripherals. This enables direct access to any parameter. The other available N40 N-File to use for explicit messaging requires considerably more configuration to achieve the same result. Every read or write message using the N40 N-Files requires configuring a request message, inputing data into the request data table, configuring a response message, and inputing data into the response data table. However, if accessing items other than parameters (for example, drive faults or events), the N40 N-Files must be used since only parameters can be accessed using the N150 N-Files.

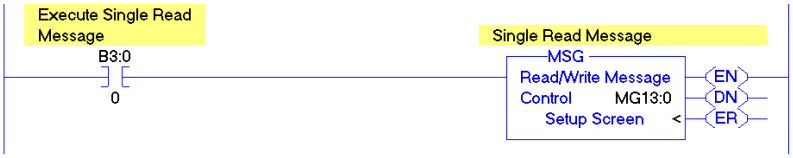
Important: When performing a write parameter message, the data will always be written to the drive's Non-Volatile Storage (NVS). Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

For PCCC N150 N-File information, refer to page C-11.

PLC-5 Example Ladder Logic Program to Read a Single Parameter

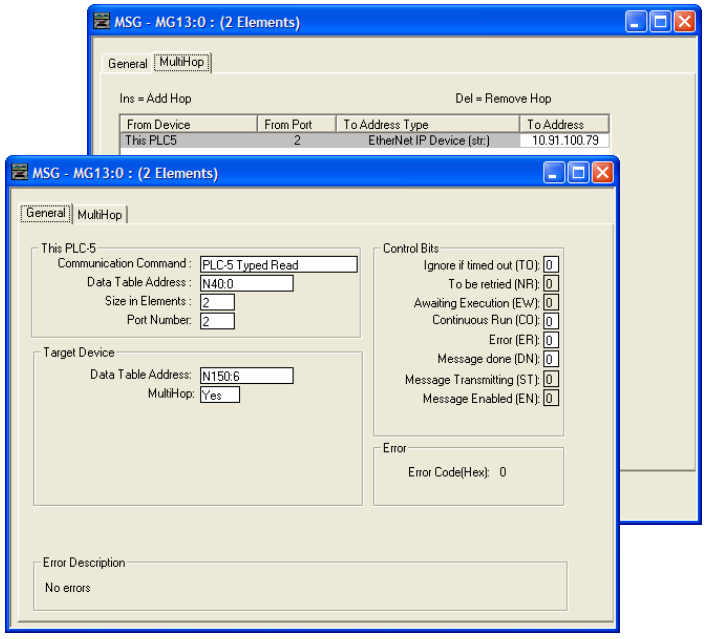
A read message is used to read a single parameter. The specific N150:6 address shown in this read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive. Footnote 2 under the Figure 6.27 table shows other N-file addressing to read various integer and REAL (floating point) parameters in PowerFlex 7-Class and PowerFlex 750-Series drives.

Figure 6.26 Example Ladder Logic to Read a Single Parameter



PLC-5 – Formatting a Message to Read a Single Parameter

Figure 6.27 Read Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a parameter.

General Tab	Example Value	Description
Communication Command	PLC-5 Typed Read	Controller type and command type for controller to read data from the drive.
Data Table Address	N40:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Elements	2 (1)	Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Port Number	2	Controller port to which the network is connected.
Data Table Address	N150:6 (2)	Specific starting address of the source file in the drive.
MultiHop	Yes	Enables communication to allow network messaging to be routed to the drive.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) Because the N-files used for the data transfer occupies two contiguous 16-bit words, the Size in Elements must always be set to 2 regardless of whether the parameter being read is a 16-bit parameter or a 32-bit parameter.

(2) See page C-11 for N-file addressing. Below are some examples of how to address N-files:

N-File Address	Data Type	Description	Notes
N150:6	32-bit integer	Parameter 3 of PowerFlex 70 drive	Example ladder logic rungs are shown in Figure 6.29 for these three different parameter data types.
N155:14	32-bit REAL	Parameter 7 of PowerFlex 750-Series drive	
N155:200	32-bit integer	Parameter 725 of PowerFlex 750-Series drive	
N209:154	32-bit REAL	Port 5: Parameter 77 of 24V I/O module in PowerFlex 750-Series drive	
N211:50	16-bit integer	Port 6: Parameter 25 of 20-COMM-E adapter in PowerFlex 750-Series drive	

PLC-5 Example Single Read Response Data

In this specific N150:6 message example, we use the data table address in Figure 6.28 to store the response value (0.13 amps) that was read from drive parameter 003 - [Output Current]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.28 Example Single Read Response Data File

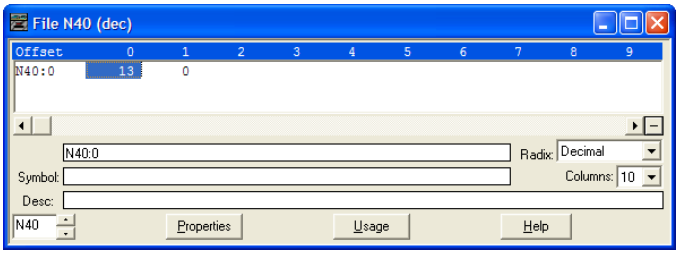


Figure 6.29 shows example ladder logic to correctly format the three possible data types for read messages in the PLC-5.

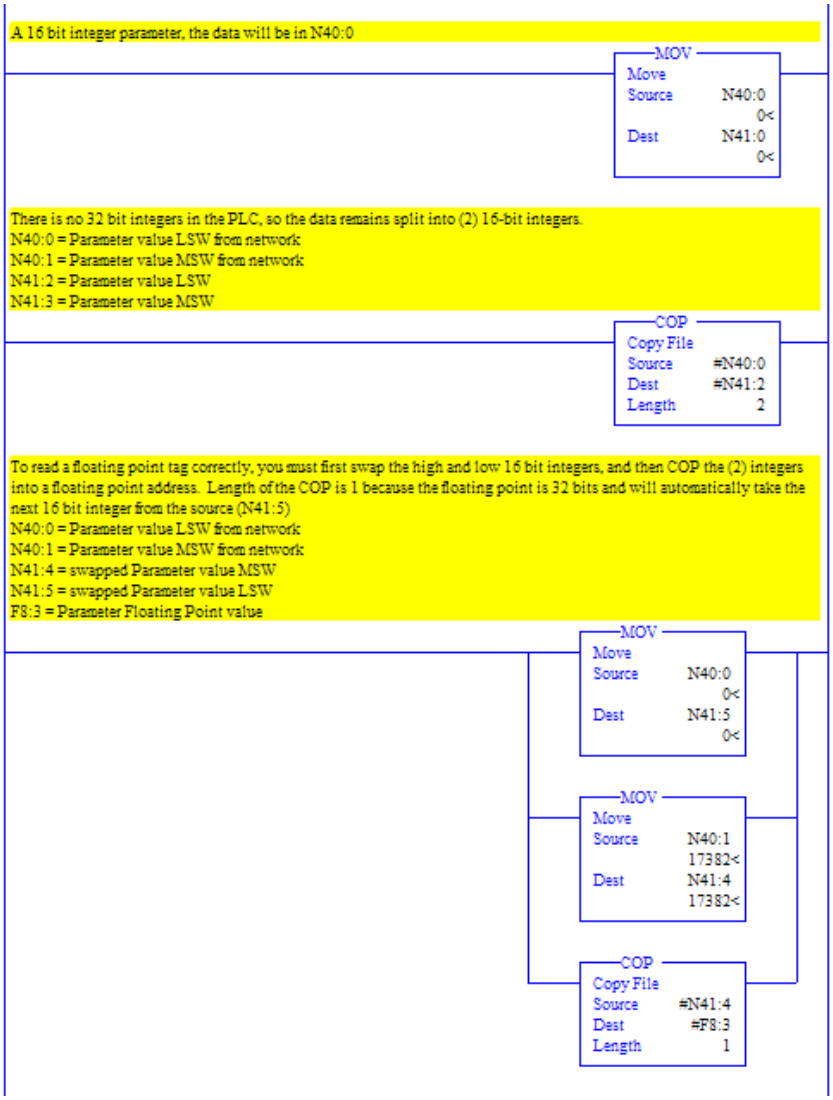
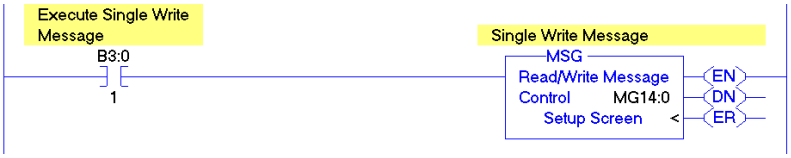
Figure 6.29 Example Ladder Logic to Format Parameter Data Types for Reads



PLC-5 Example Ladder Logic Program to Write a Single Parameter

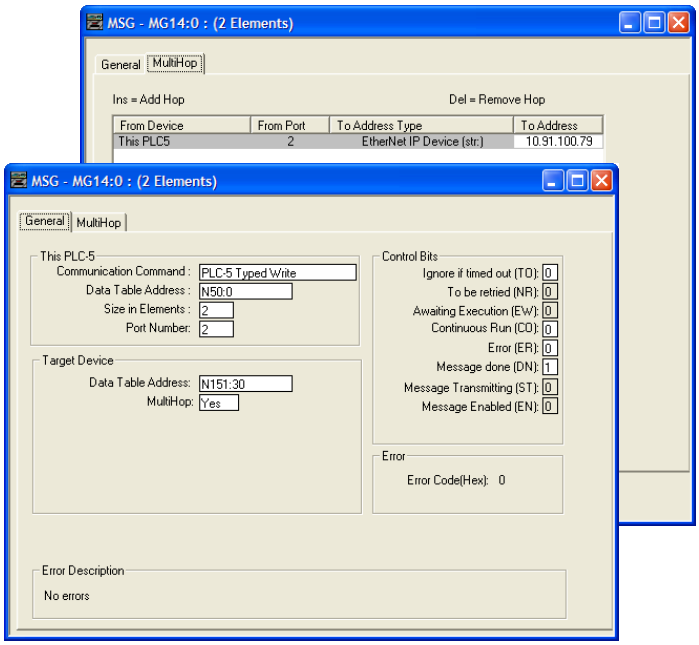
A write message is used to write to a single parameter. The specific N151:30 address shown in this write message example writes the value of parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive. Footnote 2 under the Figure 6.31 table shows other N-file addressing to write various integer and REAL (floating point) parameters in PowerFlex 7-Class and PowerFlex 750-Series drives.

Figure 6.30 Example Ladder Logic to Write a Single Parameter



PLC-5 – Formatting a Message to Write a Single Parameter

Figure 6.31 Write Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

General Tab	Example Value	Description
Communication Command	PLC-5 Typed Write	Controller type and command type for controller to write data to the drive.
Data Table Address	N50:0	An unused controller data table address containing the message instruction. This address is the starting word of the source file.
Size in Elements	2 (1)	Number of elements (words) to be transferred. Each element size is a 16-bit integer.
Port Number	2	Controller port to which the network is connected.
Data Table Address	N151:30 (2)	Specific starting address of the destination file in the drive.
MultiHop	Yes	Enables communication to allow network messaging to be routed to the drive.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) In this example, Accel Time 1 is a 16-bit parameter. Because the N151 file used for the data transfer occupies two contiguous 16-bit words, the Size in Elements must always be set to 2 regardless of whether the parameter being written to is a 16-bit parameter or a 32-bit parameter.

(2) See page C-11 for N-file addressing. Below are some examples of how to address N-files:

N-File Address	Data Type	Description	Notes
N151:30	16-bit integer	Parameter 140 of PowerFlex 70 drive	Example ladder logic rungs are shown in Figure 6.33 for these three different data types.
N150:50	32-bit REAL	Parameter 25 of PowerFlex 750-Series drive	
N155:200	32-bit integer	Parameter 725 of PowerFlex 750-Series drive	
N209:156	32-bit REAL	Port 5: Parameter 78 of 24V I/O module in PowerFlex 750-Series drive	
N201:14	16-bit integer	Port 1: Parameter 7 of 20-HIM-A6 HIM in PowerFlex 750-Series drive	

PLC-5 Example Single Write Response Data

In this specific N151:30 message example, we use the data table address in Figure 6.32 to store the request value (10.0 sec.) that was written to drive parameter 140 - [Accel Time 1]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.32 Example Single Write Response Data File

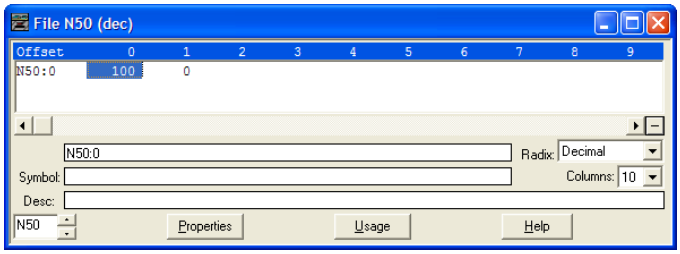


Figure 6.33 shows example ladder logic to correctly format the three possible data types for write messages in the PLC-5.

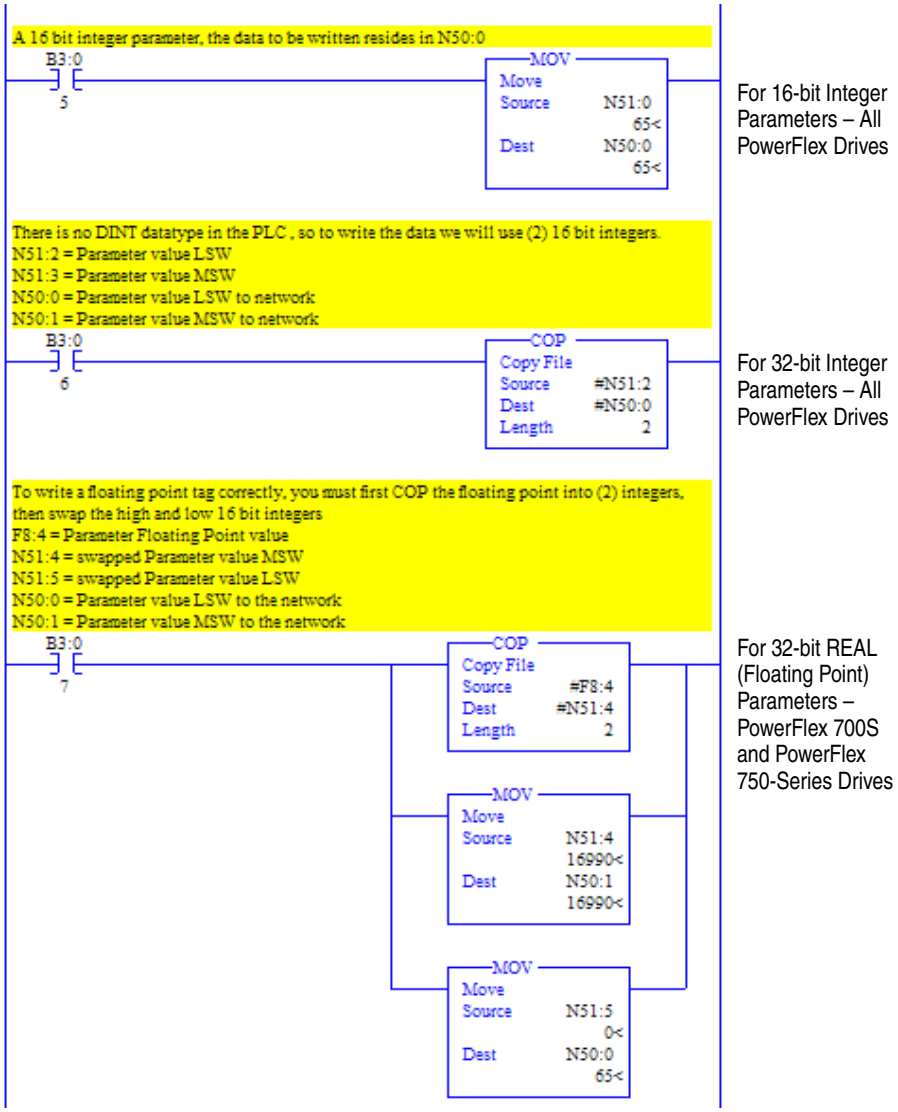
Figure 6.33 Example Ladder Logic to Format Parameter Data Types for Writes



PLC-5 Reading/Writing Multiple Parameters

You can read or write only contiguous parameters. Also, the range of contiguous parameters must be contained in the same N-File. Two elements (words) are required for each parameter being read or written. For example, to read 5 contiguous parameters, 10 elements (words) must be used.

SLC 500 Examples

When using RSLogix 500 version 7.10 or earlier, explicit messaging must be performed using the PCCC N-File method. For RSLogix 500 version 7.20 or later, the CIP messaging method has been added along with the PCCC N-File method. However, it is recommended to use the CIP method because it is easier to use and understand. For this reason, only instructions for the CIP method are provided. If you must use the PCCC N-File method, refer to the PLC-5 Examples on page 6-23.

The CIP messaging method provides two ways to perform explicit messaging:

- Read/Write Parameter Service simplifies setup by requiring less data to be entered in message configuration screens. However, the Read/Write Parameter Service can only be used to perform single parameter read or single parameter write explicit messages. (Multiple parameter reads or writes must be performed using the Generic Get/Set Attribute Service described below.)

  Important: When performing a Write Parameter message, the data will always be written to the drive's Non-Volatile Storage (NVS). Continuous NVS writes may damage the drive's EEPROM. If continuous writes are necessary, use the Generic Set Attribute Single Service and attribute A (10 decimal; see page 6-40).

- Generic Get/Set Attribute Service requires more setup data to be entered in message configuration screens, but can be used to perform single parameter read or write and multiple parameter read or write explicit messages. Also, the Generic Set Attribute Service offers the choice of writing the data to the drive's Non-Volatile Storage (NVS) or the drive's Random Access Memory (RAM; for Generic Set Attribute Single service only, see page 6-40). Note that when selecting the data to be written to RAM, the data will be lost if the drive loses power.

For supported classes, instances, and attributes, refer to Appendix C, EtherNet/IP Objects.

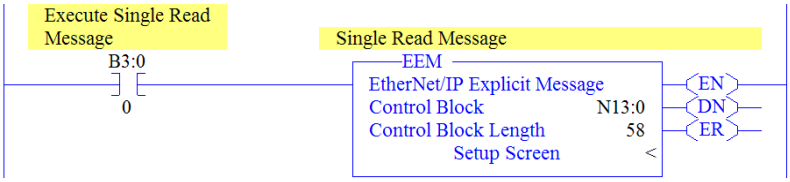
SLC 500 Explicit Messaging Using the Read/Write Parameter Service

SLC 500 Example Ladder Logic Program to Read a Single Parameter

A Read Parameter message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

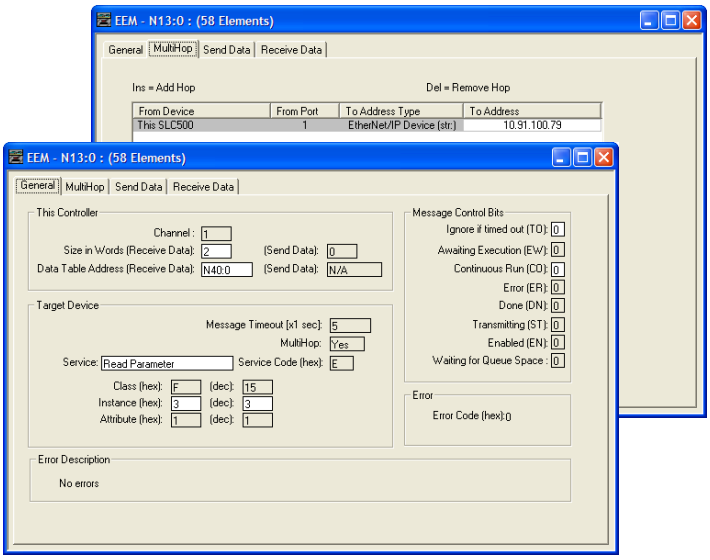
Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter read, follow the SLC 500 (Generic Attribute Service) single read example on page 6-36.

Figure 6.34 Example Ladder Logic to Read a Single Parameter



SLC 500 – Formatting a Message to Read a Single Parameter Using Read/Write Parameter Service

Figure 6.35 Read Parameter Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

General Tab	Example Value	Description
Size in Words	2 (3)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N40:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Service (1)	Read Parameter	Code for the requested service.
Instance (2)	3 (Dec.)	Instance number is the same as the parameter number.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Only drive parameters (Port 0) can be read using Parameter Object Class code 0x0F. To read a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-36).

(3) In this example, Output Current is a 32-bit parameter. If the parameter being read is a 16-bit parameter, the Size in Words would be set to 1. When the parameter being read is a 32-bit REAL (floating point) data type, the size in words would be set to 2. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

SLC 500 Example Read Single Response Data

In this message example, we use the data table address in Figure 6.36 to store the response value (0.13 amps) that was read from drive parameter 003 - [Output Current]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.36 Example Read Single Response Data File

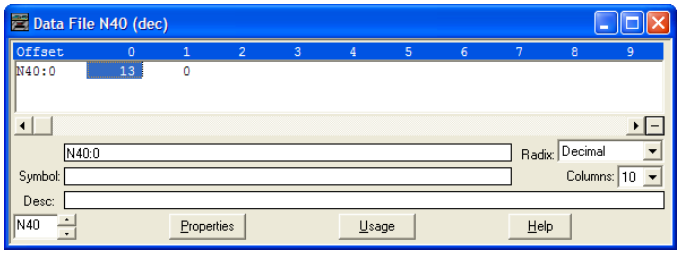


Figure 6.37 shows example ladder logic to correctly format the three possible data types for read messages in the SLC 500.

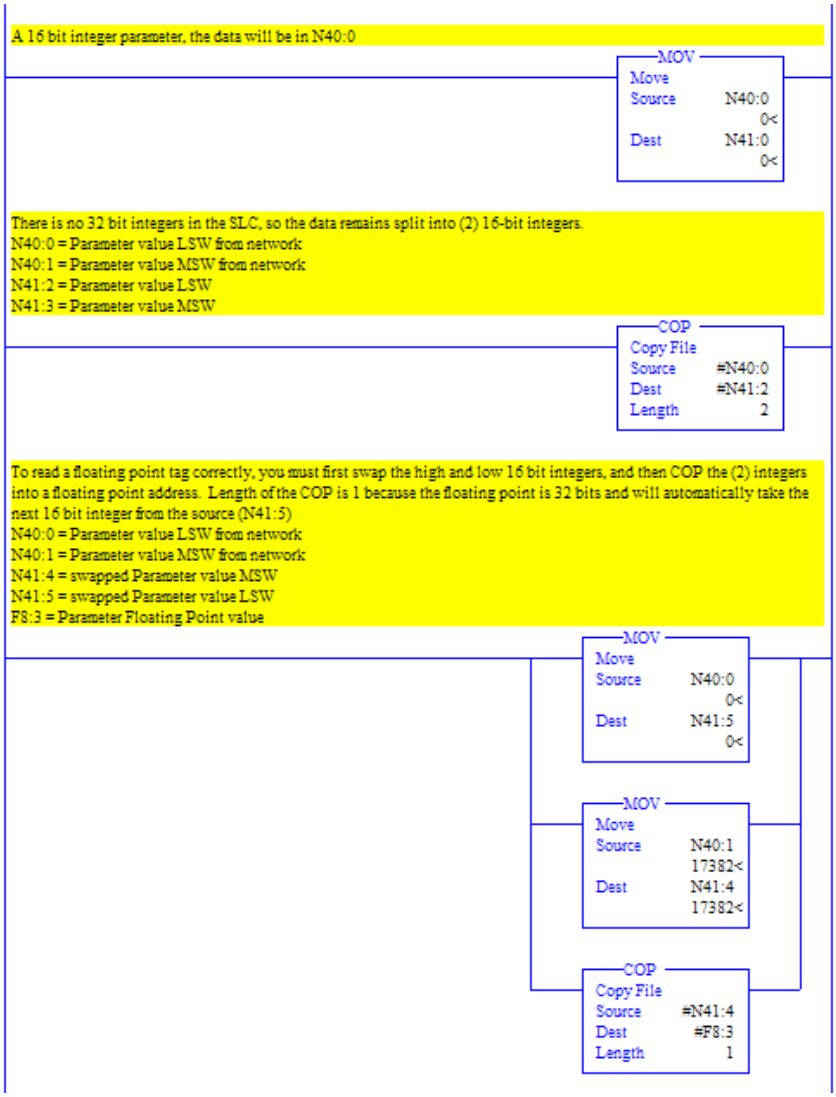
Figure 6.37 Example Ladder Logic to Format Parameter Data Types for Reads

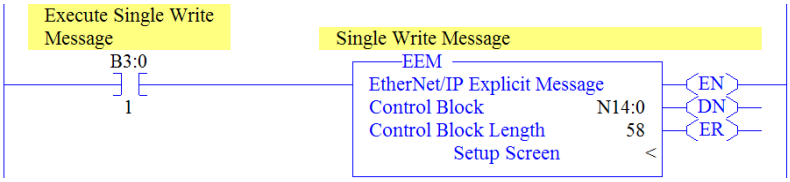


SLC 500 Example Ladder Logic Program to Write a Single Parameter Using Read/Write Parameter Service

A Write Parameter message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter write, follow the SLC 500 (Generic Attribute Service) single write example on page 6-39.

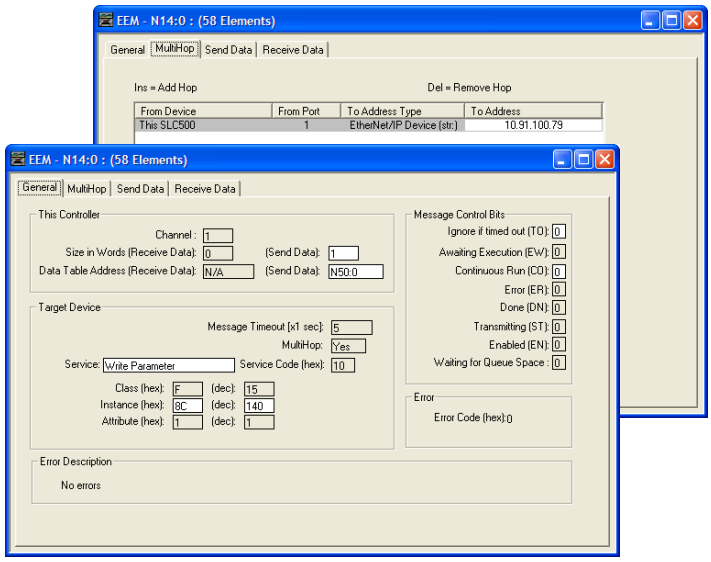
Figure 6.38 Example Ladder Logic to Write a Single Parameter



Important: If the explicit message single write must be written continuously, use DPI Parameter Object Class code 0x93 and attribute A (10 decimal; see page 6-40). This writes to RAM—not NVS (EEPROM) memory. This example single write message using Class code F writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

SLC 500 – Formatting a Message to Write a Single Parameter Using Read/Write Parameter Service

Figure 6.39 Write Parameter Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

General Tab	Example Value	Description
Size in Words	1 (3)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N50:0	An unused controller data table address containing the message instruction. This address is the starting word of the source file.
Service (1)	Write Parameter	Code for the requested service.
Instance (2)	140 (Dec.)	Instance number is the same as the parameter number.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Only drive parameters (Port 0) can be written to using Parameter Object Class code 0x0F. To write to a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-39).

(3) In this example, Accel Time 1 is a 16-bit parameter. If the parameter being written to is a 32-bit parameter, the Size in Words would be set to 2. When the parameter being written to is a 32-bit REAL (floating point) data type, the size in words would be set to 2. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

SLC 500 Example Write Single Request Data

In this message example, we use the data table address in Figure 6.40 to store the request value (10.0 sec.) that was written to drive parameter 140 - [Accel Time 1]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.40 Example Write Single Request Data File

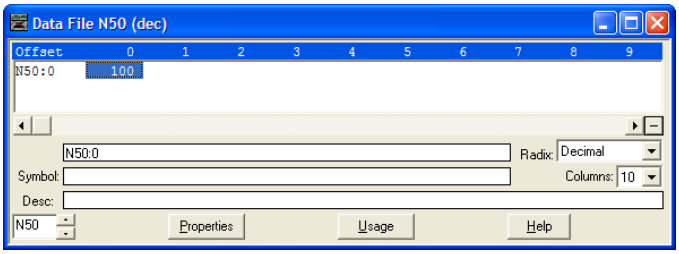


Figure 6.41 shows example ladder logic to correctly format the three possible data types for write messages in the SLC 500.

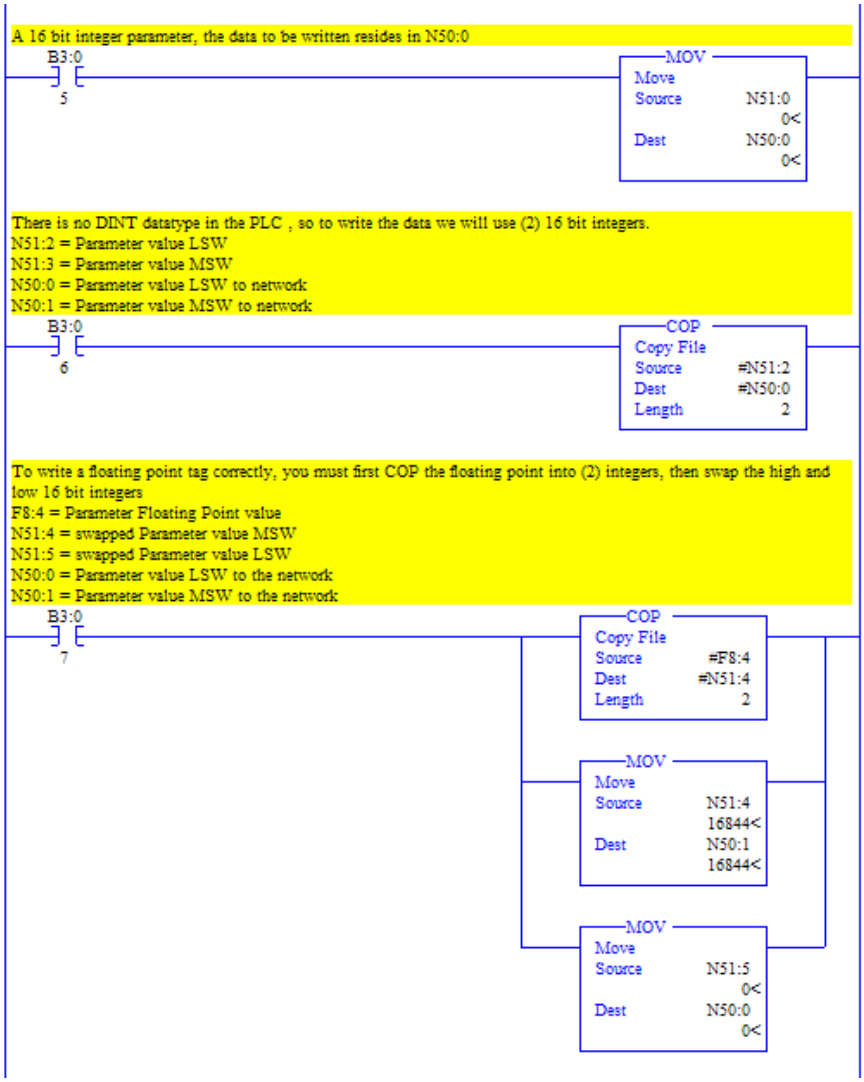
Figure 6.41 Example Ladder Logic to Format Parameter Data Types for Writes



For 16-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit REAL (Floating Point) Parameters – PowerFlex 700S Drives

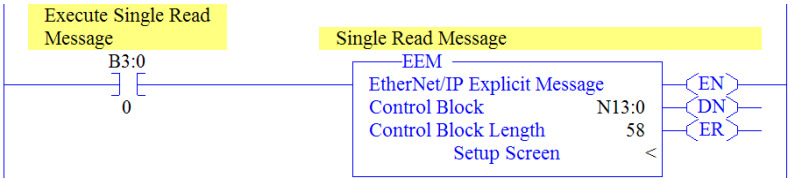
SLC 500 Explicit Messaging Using the Generic Get/Set Attribute Service

SLC 500 Example Ladder Logic Program to Read a Single Parameter

A Generic Get Attribute Single message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

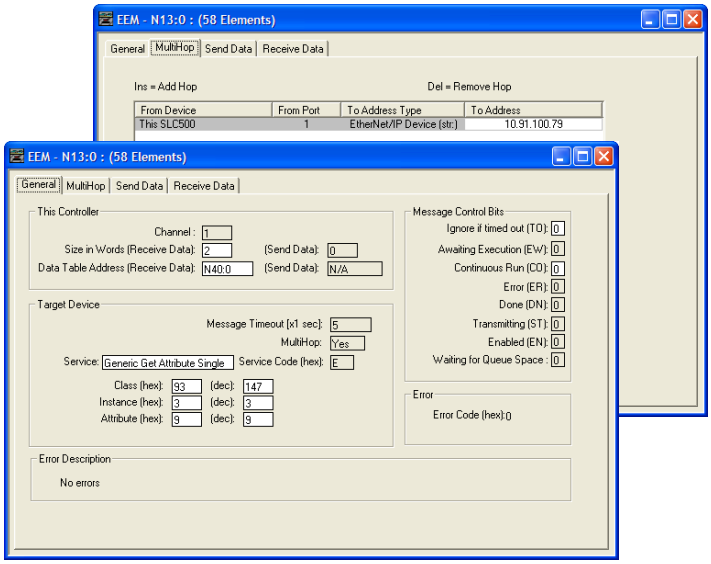
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.42 Example Ladder Logic to Read a Single Parameter



SLC 500 – Formatting a Message to Read a Single Parameter Using Generic Get/Set Attribute Service

Figure 6.43 Generic Get Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

General Tab	Example Value	Description
Size in Words	2 (3)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N40:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Service (1)	Generic Get Attribute Single	Code for the requested service.
Class	93 or 9F (Hex.) (4)	Class ID for the DPI Parameter Object.
Instance (2)	3 (Dec.)	Instance number is the same as the parameter number.
Attribute	9 (Dec.)	Attribute number for the Parameter Value attribute.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) The instance is the parameter number in the drive (Port 0). For example, to read parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

(3) In this example, Output Current is a 32-bit parameter. If the parameter being read is a 16-bit parameter, the Size in Words would be set to 1. When the parameter being read is a 32-bit REAL (floating point) data type, the size in words would be set to 2. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

(4) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

SLC 500 Example Get Attribute Single Response Data

In this message example, we use the data table address in Figure 6.44 to store the response value (0.13 amps) that was read from drive parameter 003 - [Output Current]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.44 Example Get Attribute Single Response Data File

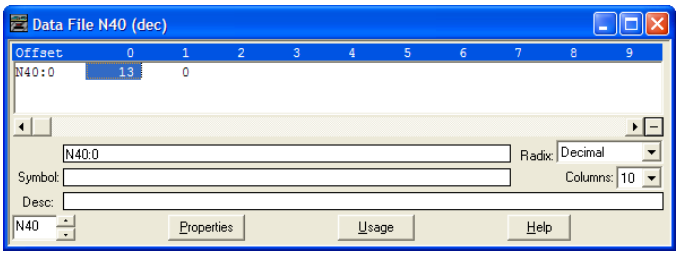


Figure 6.45 shows example ladder logic to correctly format the three possible data types for get messages in the SLC 500.

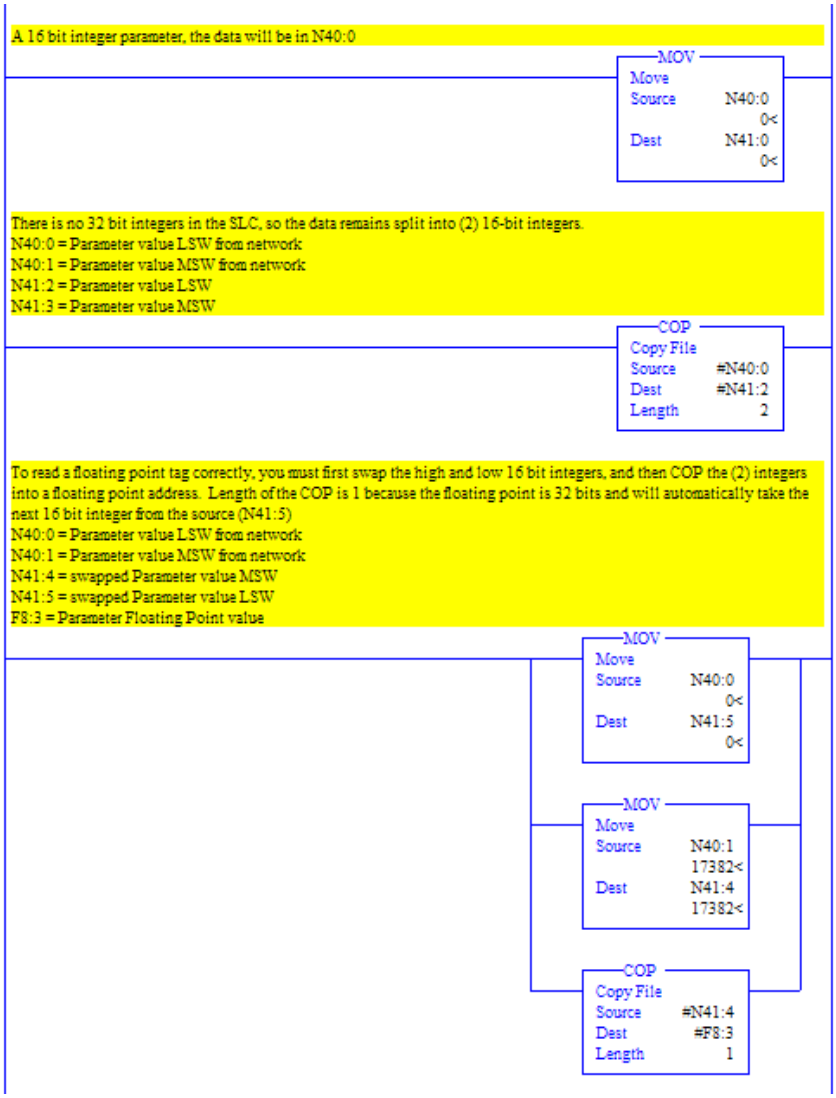
Figure 6.45 Example Ladder Logic to Format Parameter Data Types for Gets

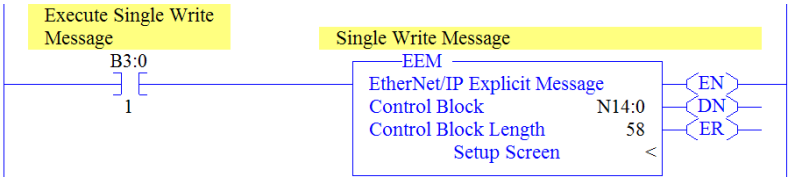


SLC 500 Example Ladder Logic Program to Write a Single Parameter Using Generic Get/Set Attribute Service

A Generic Set Attribute Single message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

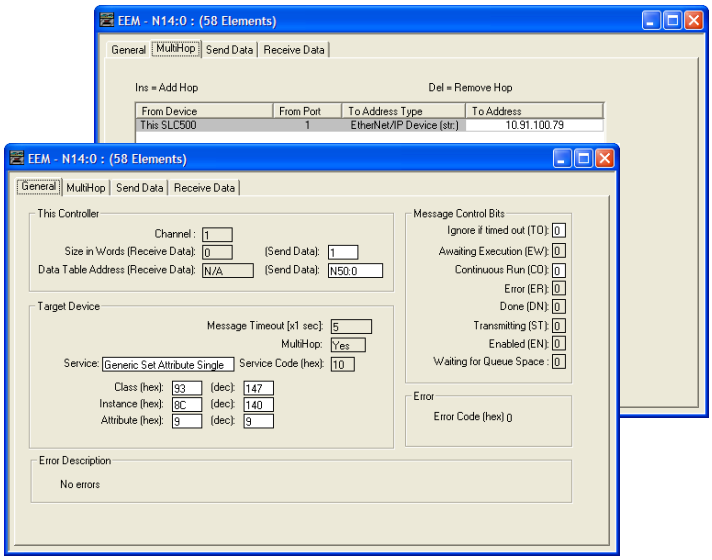
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.46 Example Ladder Logic to Write a Single Parameter



SLC 500 – Formatting a Message to Write a Single Parameter Using Generic Get/Set Attribute Service

Figure 6.47 Generic Set Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

General Tab	Example Value	Description
Size in Words	1 (4)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N50:0	An unused controller data table address containing the message instruction. This address is the starting word of the source file.
Service (1)	Generic Set Attribute Single	Code for the requested service.
Class	93 or 9F (Hex.) (5)	Class ID for the DPI Parameter Object.
Instance (2)	140 (Dec.)	Instance number is the same as the parameter number.
Attribute (3)	9 or 10 (Dec.)	Attribute number for the Parameter Value attribute.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) The instance is the parameter number in the drive (Port 0). For example, to write to parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

(3) Setting the Attribute value to “9” will write the parameter value to the drive’s Non-Volatile Storage (EEPROM) memory, so the parameter value will remain even after the drive is power cycled. **Important:** When set to “9,” be very cautious as the EEPROM may quickly exceed its life cycle and cause the drive to malfunction. Setting the Attribute value to “A” (10 decimal) will write the parameter value to temporary memory, so the parameter value will be lost after the drive is power cycled. It is recommended to use the “A” (10 decimal) setting when frequent write messages are required.

(4) In this example, Accel Time 1 is a 16-bit parameter. If the parameter being written to is a 32-bit parameter, the Size in Words would be set to 2. When the parameter being written to is a 32-bit REAL (floating point) data type, the size in words would be set to 2. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

(5) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

SLC 500 Example Set Attribute Single Request Data

In this message example, we use the data table address in Figure 6.48 to store the request value (10.0 sec.) that was written to drive parameter 140 - [Accel Time 1]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.48 Example Set Attribute SIngle Request Data File

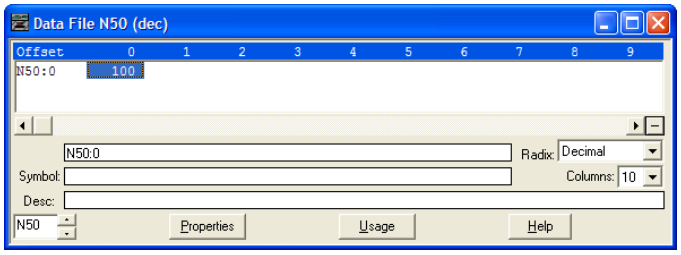


Figure 6.49 shows example ladder logic to correctly format the three possible data types for set messages in the SLC 500.

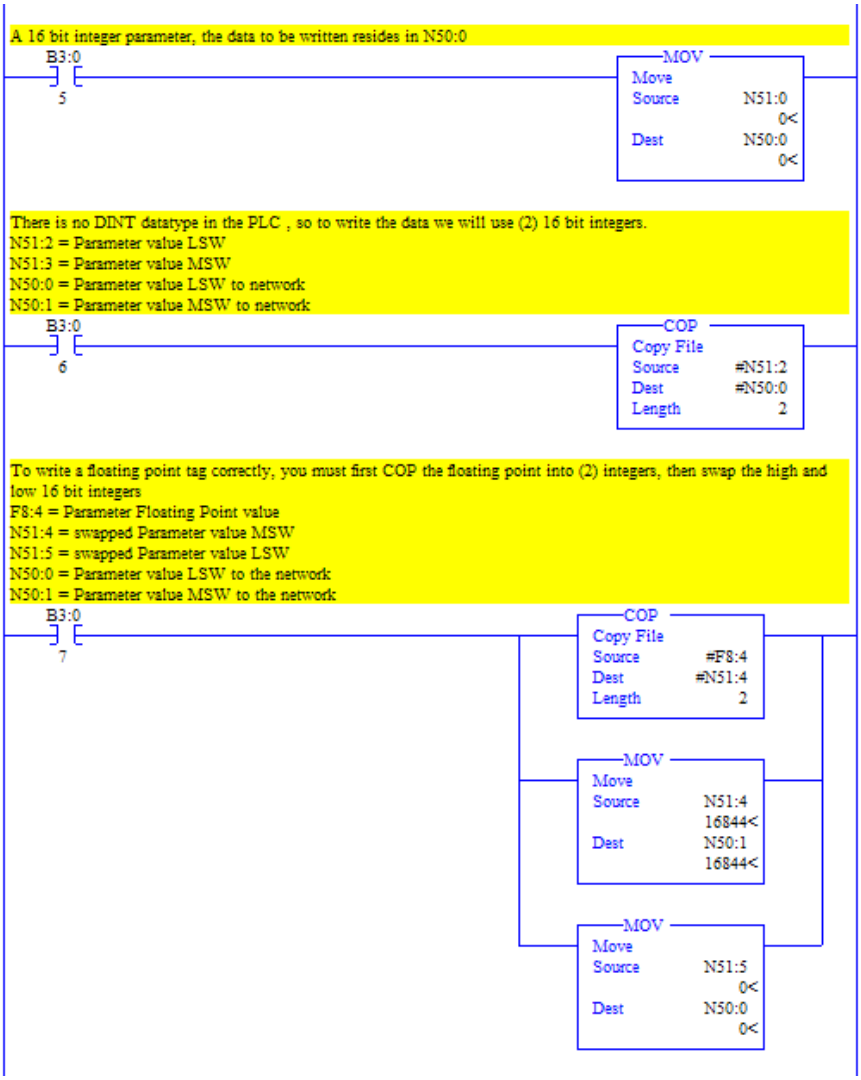
Figure 6.49 Example Ladder Logic to Format Parameter Data Types for Sets



For 16-bit Integer Parameters – All PowerFlex Drives

For 32-bit Integer Parameters – All PowerFlex Drives

For 32-bit REAL (Floating Point) Parameters – PowerFlex 700S and PowerFlex 750-Series Drives

SLC 500 Example Ladder Logic Program to Read Multiple Parameters Using Generic Get/Set Attribute Service

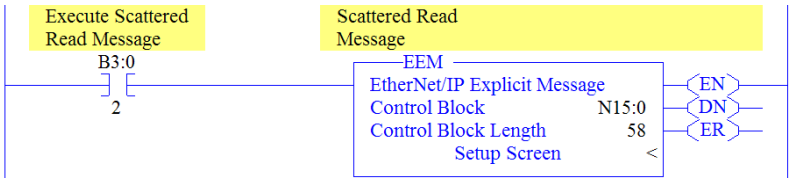
A Custom scattered read message is used to read the values of multiple parameters. This read message example reads the values of these five parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

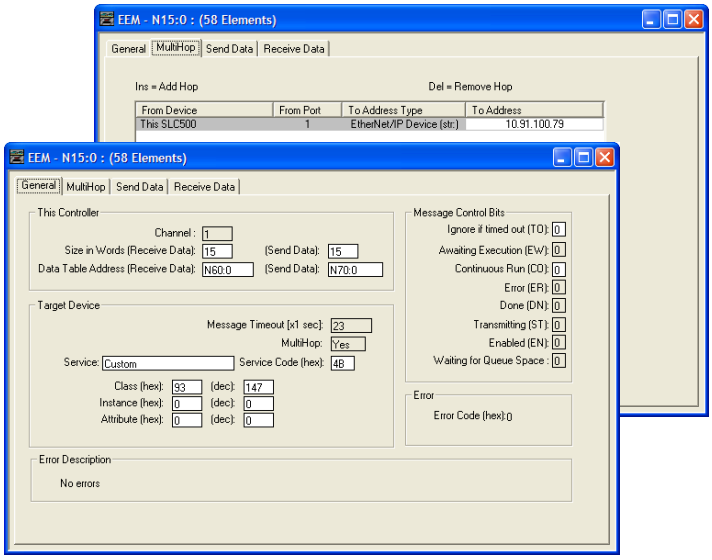
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.50 Example Ladder Logic to Read Multiple Parameters



SLC 500 – Formatting a Message to Read Multiple Parameters Using Generic Get/Set Attribute Service

Figure 6.51 Custom Scattered Read Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read multiple parameters.

General Tab	Example Value	Description
Size in Words	15 (2)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N60:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Service (1)	Custom	Required for scattered messages.
Service Code	4B (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Dec.)	Required for scattered messages.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) In this example, we are reading five parameters. Each parameter being read requires three contiguous 16-bit words. Scattered read messages always assume that every parameter being read is a 32-bit parameter, regardless of its actual size. The data structure format is the same as shown on page 6-52. Maximum length is 66 words, which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

SLC 500 Example Scattered Read Request Data

In this message example, we use the data table addresses in Figure 6.52 or Figure 6.53 to store the request values to be read from these drive parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.52 Example Scattered Read Request Data File for PowerFlex 7-Class Drive

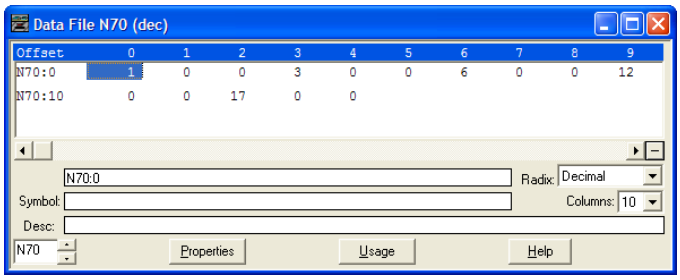


Figure 6.53 Example Scattered Read Request Data File for PowerFlex 750-Series Drive

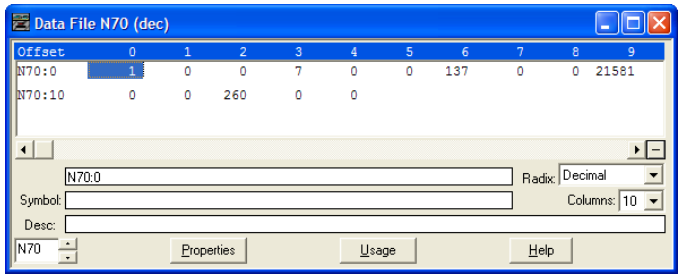
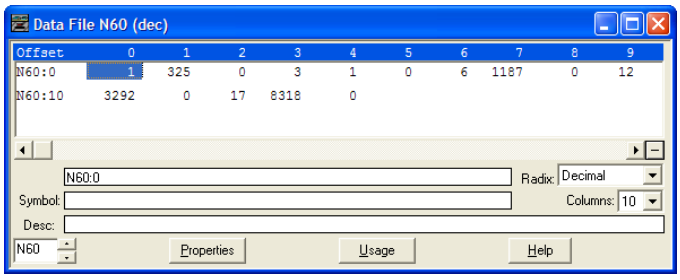


SLC 500 Example Scattered Read Response Data

In this message example, we use the data table addresses in Figure 6.54 or Figure 6.55 to store the response values that were read from the requested drive parameters.

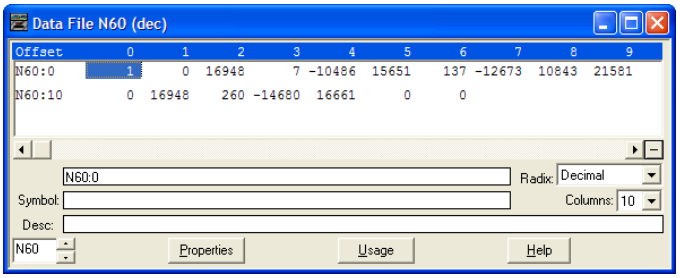
Figure 6.54 Example Scattered Read Response Data File for PowerFlex 7-Class Drive



In this example, the parameters have the following values:

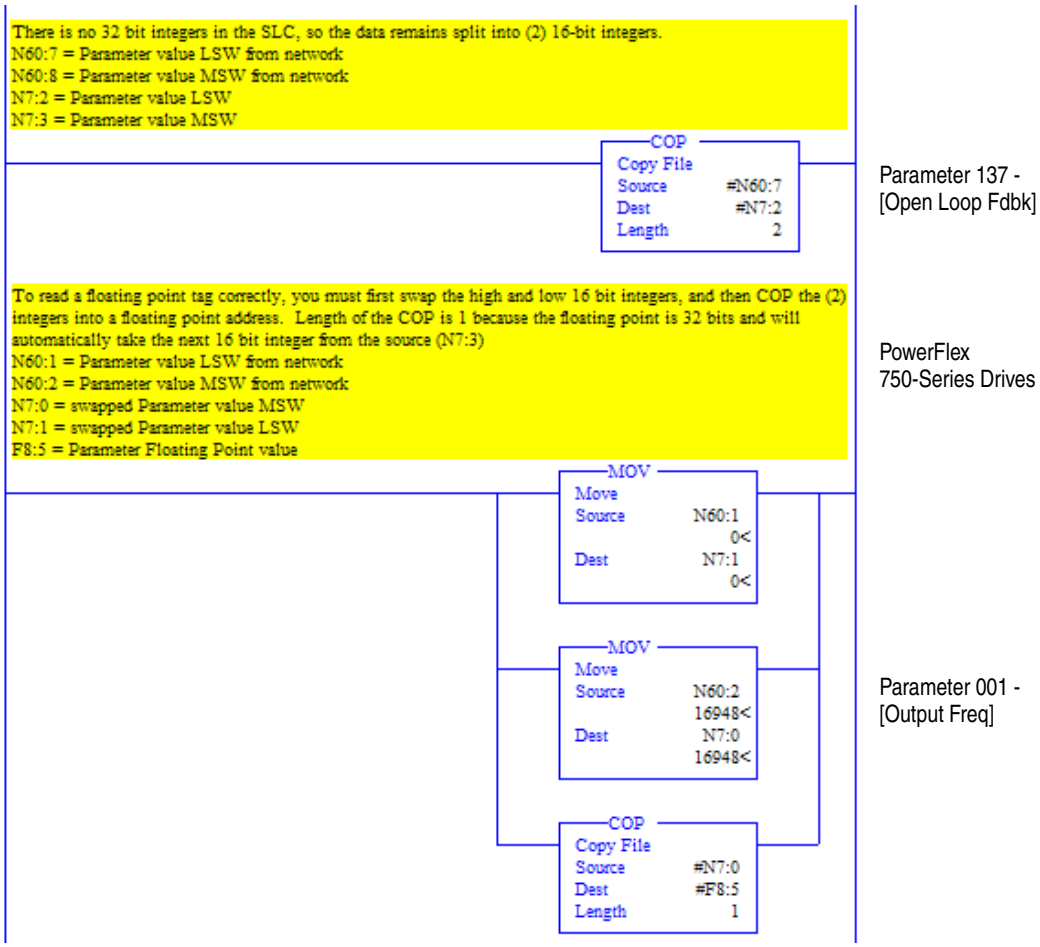
PowerFlex 7-Class Drive Parameter	Address	Read Value
1 - [Output Freq]	N60:1	32.5 Hz
3 - [Output Current]	N60:4	0.01 Amp
6 - [Output Voltage]	N60:7	118.7 VAC
12 - [DC Bus Voltage]	N60:10	329.2 VDC
17 - [Analog In2 Value]	N60:13	8.318 mA

Figure 6.55 Example Scattered Read Response Data File for PowerFlex 750-Series Drive



The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP command must be used to copy the N60 integer array to a 16-bit integer or floating tag. Figure 6.56 shows the ladder logic used for this example. If the parameter data type is a 32-bit integer, the data remains split into two 16-bit integers since there are no 32-bit integers in the SLC 500. If the parameter data type is a REAL, then the destination tag is a floating point. In this case, the value must first be swapped with the high and low 16-bit integers, and then the two integers copied (COP) into a floating point address. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.56 Example Ladder Logic to Copy Response Data for PowerFlex 750-Series Drive



In this message example, the parameters have the following values:

PowerFlex 750-Series Drive Parameter	Read Value	Data Type
1 - [Output Freq]	45.0 Hz	REAL
7 - [Output Current]	0.04 Amp	REAL
137 - [Open Loop Fdbk]	710659711	DINT
21581 - [Port 5: Analog Out 0 Data]	45.0 Hz	REAL
260 - [Analog In0 Value]	9.361 Volts	REAL

SLC 500 Example Ladder Logic Program to Write Multiple Parameters Using Generic Get/Set Attribute Service

A Custom scattered write message is used to write to multiple parameters. This write message example writes the following values to these five parameters:

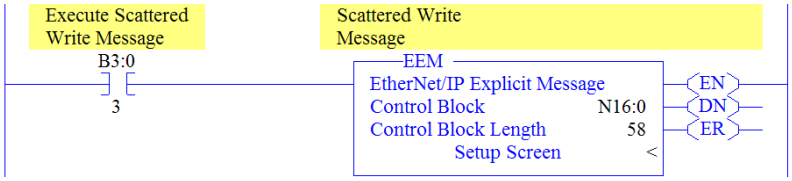
PowerFlex 7-Class Drive Parameter	Write Value
141 - [Accel Time 2]	11.1 Sec.
143 - [Decel Time 2]	22.2 Sec.
105 - [Preset Speed 5]	33.3 Hz.
106 - [Preset Speed 6]	44.4 Hz.
107 - [Preset Speed 7]	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value
536 - [Accel Time 2]	11.1 Sec.
538 - [Decel Time 2]	22.2 Sec.
725 - [Zero Position]	33
21555 - [Port 5: Analog In0 Hi]	5.5
780 - [PTP Setpoint]	-75,555

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

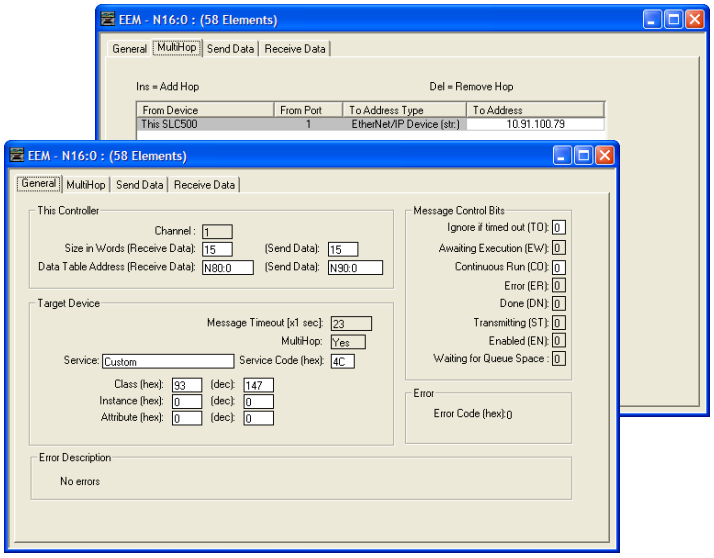
Figure 6.57 Example Ladder Logic to Write Multiple Parameters



Important: If the explicit message scattered write must be written continuously, then use a separate Generic Set service explicit message single write for each parameter using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F and attribute A (10 decimal; see page 6-40). Attribute A writes to RAM—not NVS (EEPROM) memory. This example scattered write message using attribute 0 writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

SLC 500 – Formatting a Message to Write Multiple Parameters Using Generic Get/Set Attribute Service

Figure 6.58 Custom Scattered Write Multiple Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write multiple parameters.

General Tab	Example Value	Description
Size in Words	15 (2)	Number of words to be transferred. Each word size is a 16-bit integer.
Data Table Address	N80:0	An unused controller data table address containing the message instruction. This address is the starting word of the source file.
Service (1)	Custom	Required for scattered messages.
Service Code	4C (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Dec.)	Required for scattered messages.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) In this example, we are writing to five parameters. Each parameter being written to requires three contiguous 16-bit words. Scattered write messages always assume that every parameter being written to is a 32-bit parameter, regardless of its actual size. The data structure format is the same as shown on page 6-52. Maximum length is 66 words, which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

SLC 500 Example Scattered Write Request Data

In this message example, we use the data table addresses in Figure 6.59 or to store the request values to be written to these drive parameters:

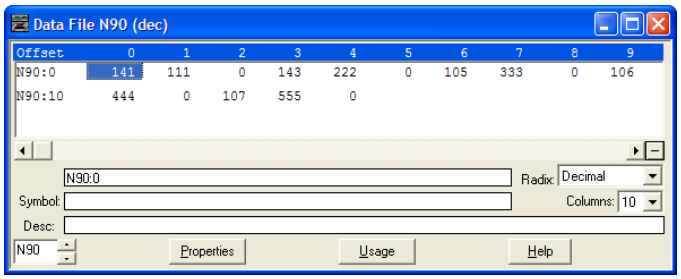
PowerFlex 7-Class Drive Parameter	Address	Write Value
141 - [Accel Time 2]	N90:1	11.1 Sec.
143 - [Decel Time 2]	N90:4	22.2 Sec.
105 - [Preset Speed 5]	N90:7	33.3 Hz.
106 - [Preset Speed 6]	N90:10	44.4 Hz.
107 - [Preset Speed 7]	N90:13	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value	Data Type
536 - [Accel Time 2]	11.1 Sec.	REAL
538 - [Decel Time 2]	22.2 Sec.	REAL
725 - [Zero Position]	33	32-bit integer
21555 - [Port 5: Analog In0 Hi]	5.5	REAL
780 - [PTP Setpoint]	-75,555	32-bit integer

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.59 or Figure 6.62 shows the parameter values.

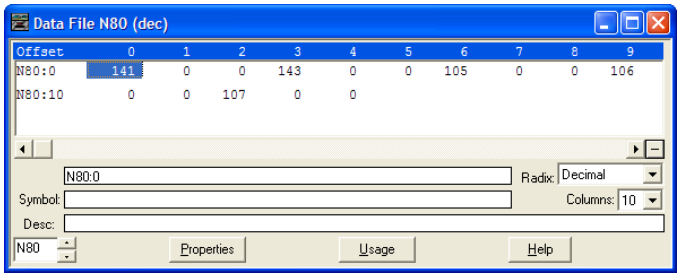
Figure 6.59 Example Scattered Write Request Data File for PowerFlex 7-Class Drive



SLC 500 Example Scattered Write Response Data

In this message example, we use the data table addresses in Figure 6.60 to store the response values that were written to the requested drive parameters. Values of “0” indicate no errors occurred.

Figure 6.60 Example Scattered Write Response Data File for PowerFlex 7-Class Drive



The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP command must be used to copy the 16-bit integer or REAL values to the N90 integer array. Figure 6.61 shows the ladder logic used for this example. If the parameter data type is a 32-bit integer, the data remains split into two 16-bit integers since there are no 32-bit integers in the SLC 500. If the parameter data type is a REAL, the floating point value in the SLC 500

is copied (COP) to two 16-bit integers. Then the MSW (most significant word) and LSW (least significant word) must be swapped before moving (MOV) the values to the array to be written to. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.61 Example Ladder Logic to Copy Request Data for PowerFlex 750-Series Drive

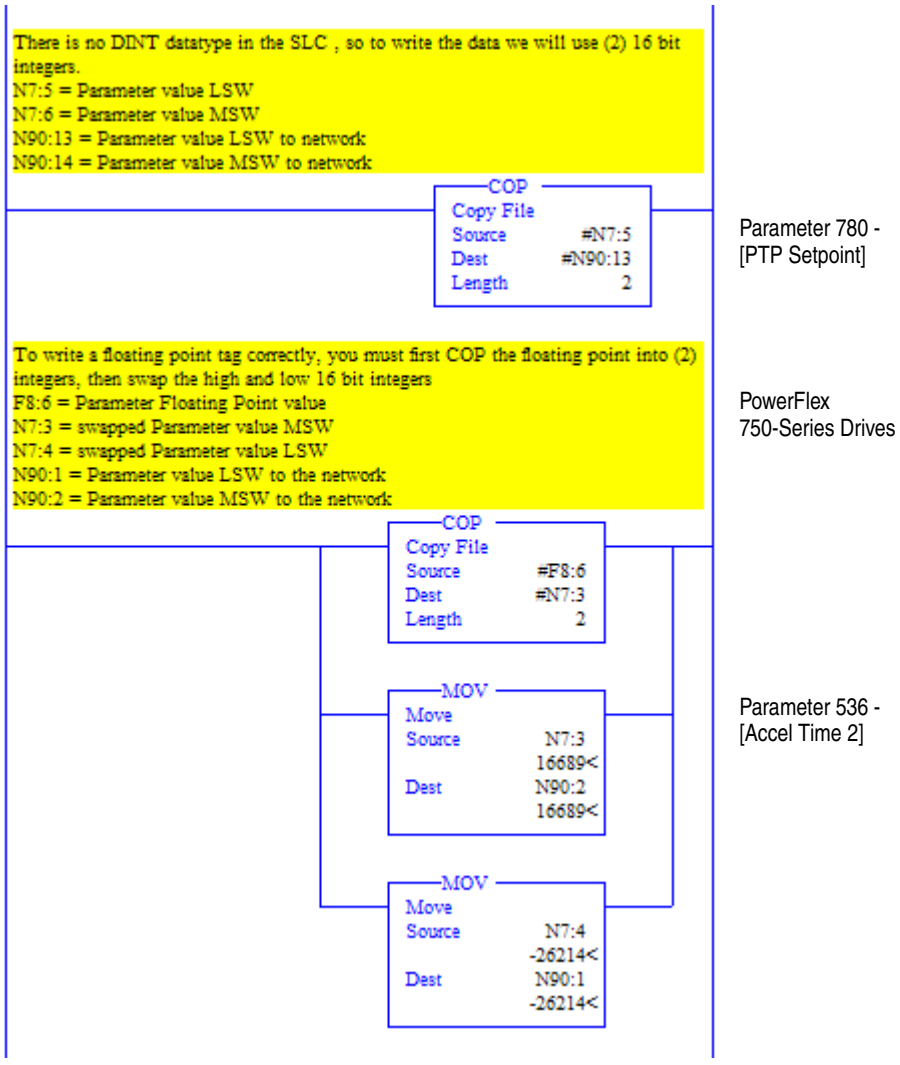


Figure 6.62 Example Scattered Write Request Data File for PowerFlex 750-Series Drive

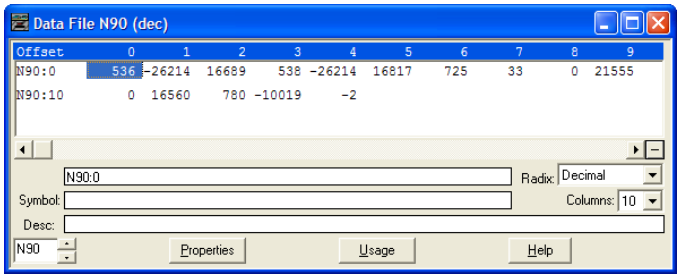
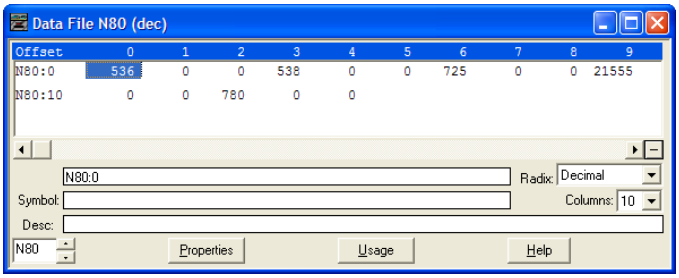


The results of the explicit message appear in the destination tag array N80 (Figure 6.63). Values of “0” indicate no errors occurred.

Figure 6.63 Example Scattered Write Response Data File for PowerFlex 750-Series Drive



SLC 500 – Explanation of Request and Response Data for Read/Write Multiple Messaging

The data structures in Figure 6.64 and Figure 6.65 use 16-bit words and can accommodate up to 22 parameters in a single message. In the Response Message, a parameter number with the high bit set indicates that the associated parameter value field contains an error code (parameter number in response data will be negative).

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

MicroLogix 1100/1400 Examples

When using RSLogix 500 version 7.10 or earlier, explicit messaging must be performed using the PCCC N-File method. For RSLogix 500 version 7.20 or later, the CIP messaging method has been added along with the PCCC N-File method. However, it is recommended to use the CIP method because it is easier to use and understand. For this reason, only instructions for the CIP method are provided. If you must use the PCCC N-File method, refer to the PLC-5 Examples on page 6-23.

The CIP messaging method provides two ways to perform explicit messaging:

- Read/Write Parameter Service simplifies setup by requiring less data to be entered in message configuration screens. However, the Read/Write Parameter Service can only be used to perform single parameter read or single parameter write explicit messages. (Multiple parameter reads or writes must be performed using the Generic Get/Set Attribute Service described below.)

  Important: When performing a Write Parameter message, the data will always be written to the drive's Non-Volatile Storage (NVS). Continuous NVS writes may damage the drive's EEPROM. If continuous writes are necessary, use the Generic Set Attribute Single Service and attribute A (10 decimal; see page 6-64).

- Generic Get/Set Attribute Service requires more setup data to be entered in message configuration screens, but can be used to perform single parameter read or write and multiple parameter read or write explicit messages. Also, the Generic Set Attribute Service offers the choice of writing the data to the drive's Non-Volatile Storage (NVS) or the drive's Random Access Memory (RAM; for Generic Set Attribute Single service only, see page 6-64). Note that when selecting the data to be written to RAM, the data will be lost if the drive loses power.

For supported classes, instances, and attributes, refer to Appendix C, EtherNet/IP Objects.

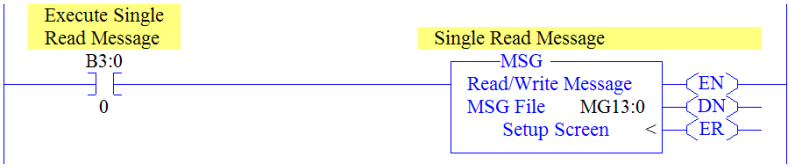
MicroLogix 1100/1400 Explicit Messaging Using the Read/Write Parameter Service

MicroLogix 1100/1400 Example Ladder Logic Program to Read a Single Parameter

A Read Parameter message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

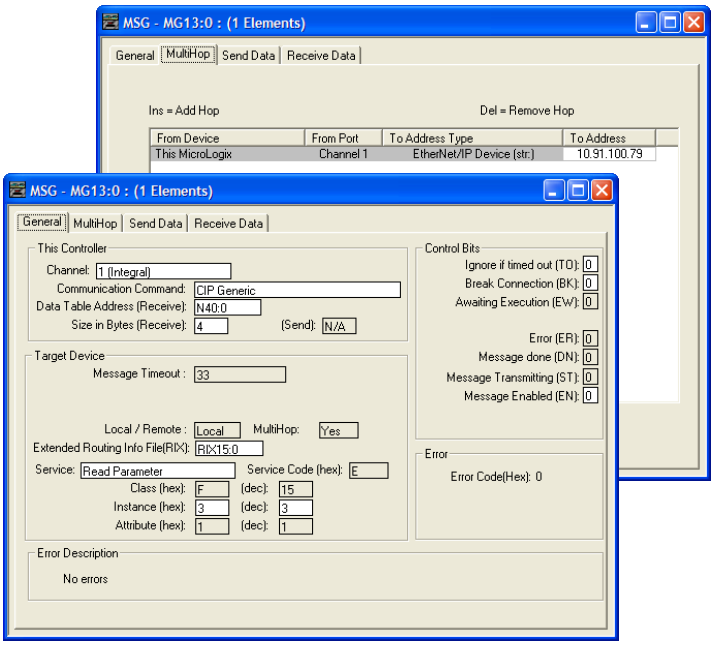
Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter read, follow the MicroLogix 1100/1400 (Generic Attribute Service) single read example on page 6-60.

Figure 6.66 Example Ladder Logic to Read a Single Parameter



MicroLogix 1100/1400 – Formatting a Message to Read a Single Parameter Using Read/Write Parameter Service

Figure 6.67 Read Parameter Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N40:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	4 (3)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX15:0	An unused routing information file for the controller.
Service (1)	Read Parameter	Code for the requested service.
Instance (2)	3 (Dec.)	Instance number is the same as the parameter number.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Only drive parameters (Port 0) can be read using Parameter Object Class code 0x0F. To read a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-60).

(3) In this example, Output Current is a 32-bit parameter. If the parameter being read is a 16-bit parameter, the Size in Bytes would be set to 2. When the parameter being read is a 32-bit REAL (floating point) data type, the size in bytes would be set to 4. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

MicroLogix 1100/1400 Example Read Single Response Data

In this message example, we use the data table address in Figure 6.68 to store the response value (0.13 amps) that was read from drive parameter 003 - [Output Current]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.68 Example Read Single Response Data File

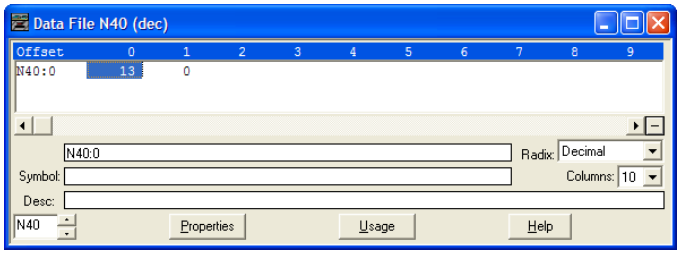


Figure 6.69 shows example ladder logic to correctly format the three possible data types for read messages in the MicroLogix 1100/1400.

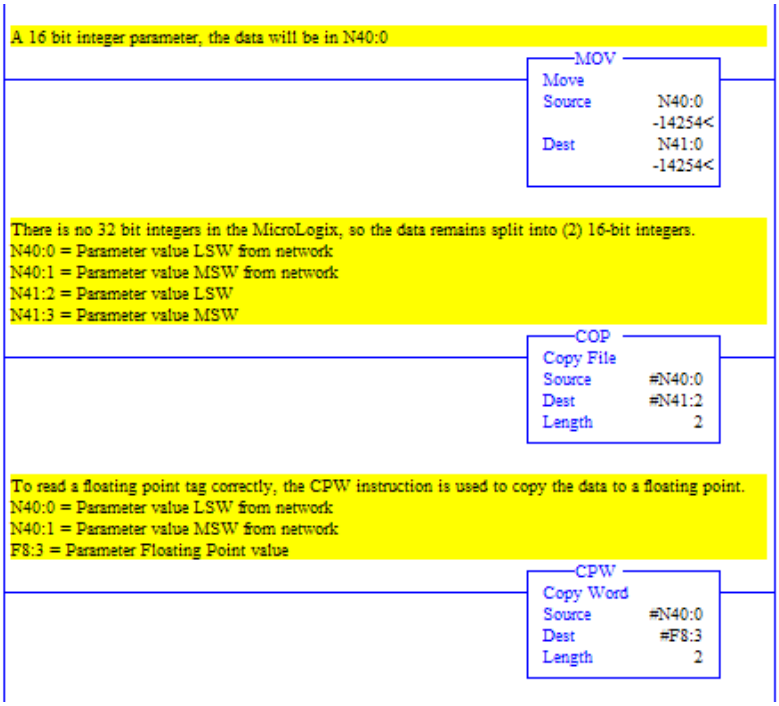
Figure 6.69 Example Ladder Logic to Format Parameter Data Types for Reads

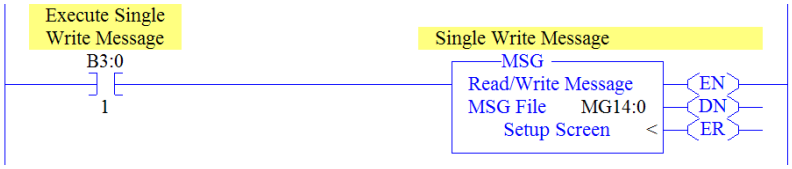


MicroLogix 1100/1400 Example Ladder Logic Program to Write a Single Parameter Using Read/Write Parameter Service

A Write Parameter message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

Important: Parameter Object Class code 0x0F is not supported in PowerFlex 750-Series drives. To do a single parameter write, follow the SLC 500 (Generic Attribute Service) single write example on page 6-63.

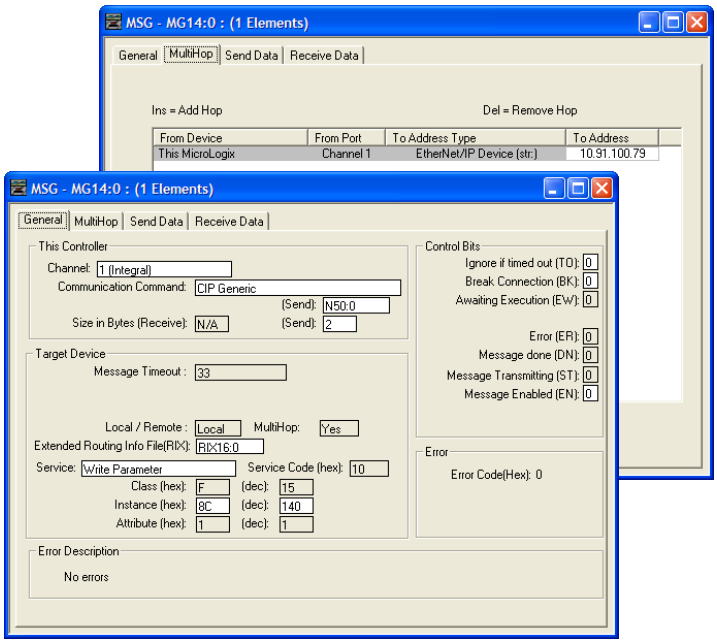
Figure 6.70 Example Ladder Logic to Write a Single Parameter



Important: If the explicit message single write must be written continuously, use DPI Parameter Object Class code 0x93 and attribute A (10 decimal; see page 6-64). This writes to RAM—not NVS (EEPROM) memory. This example single write message using Class code F writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

MicroLogix 1100/1400 – Formatting a Message to Write a Single Parameter Using Read/Write Parameter Service

Figure 6.71 Write Parameter Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N50:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	2 (3)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX16:0	An unused routing information file for the controller.
Service (1)	Write Parameter	Code for the requested service.
Instance (2)	140 (Dec.)	Instance number is the same as the parameter number.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) Only drive parameters (Port 0) can be written to using Parameter Object Class code 0x0F. To write to a parameter of a peripheral in another port, use DPI Parameter Object Class code 0x93 (see page 6-63).

(3) In this example, Accel Time 1 is a 16-bit parameter. If the parameter being written to is a 32-bit parameter, the Size in Bytes would be set to 4. When the parameter being written to is a 32-bit REAL (floating point) data type, the size in bytes would be set to 4. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

MicroLogix 1100/1400 Example Write Single Request Data

In this message example, we use the data table address in Figure 6.72 to store the request value (10.0 sec.) that was written to drive parameter 140 - [Accel Time 1]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.72 Example Write Single Request Data File

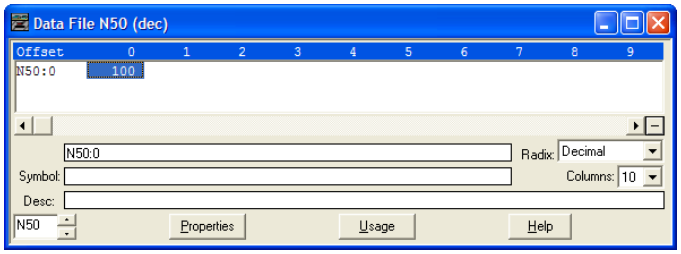


Figure 6.73 shows example ladder logic to correctly format the three possible data types for write messages in the MicroLogix 1100/1400.

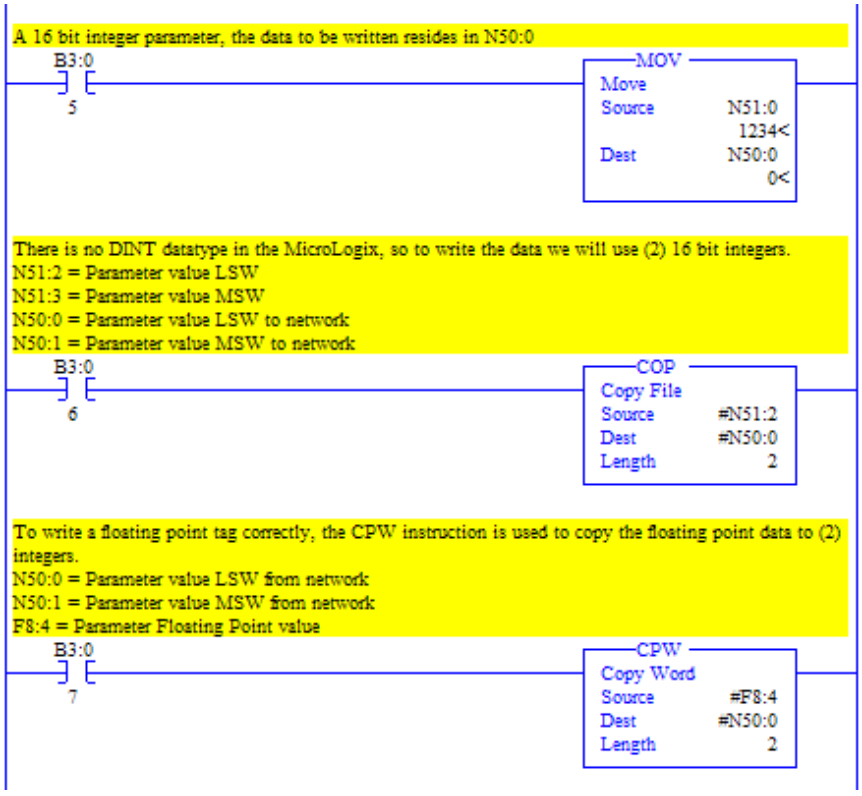
Figure 6.73 Example Ladder Logic to Format Parameter Data Types for Writes



For 16-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit REAL (Floating Point) Parameters – PowerFlex 700S Drives

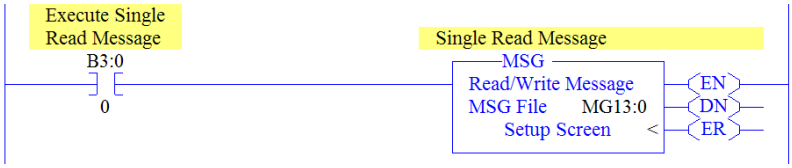
MicroLogix 1100/1400 Explicit Messaging Using the Generic Get/Set Attribute Service

MicroLogix 1100/1400 Example Ladder Logic Program to Read a Single Parameter

A Generic Get Attribute Single message is used to read a single parameter. This read message example reads the value of parameter 003 - [Output Current] in a PowerFlex 7-Class drive.

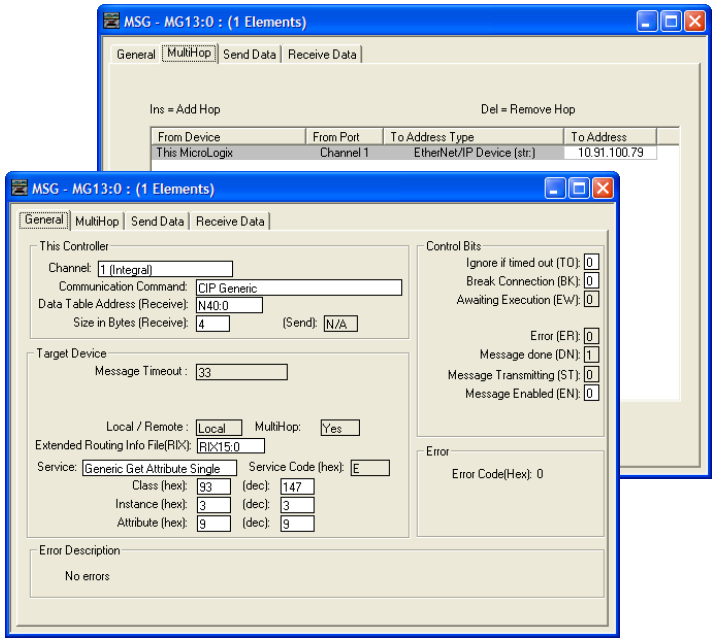
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.74 Example Ladder Logic to Read a Single Parameter



MicroLogix 1100/1400 – Formatting a Message to Read a Single Parameter Using Generic Get/Set Attribute Service

Figure 6.75 Generic Get Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read a single parameter.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N40:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	4 (3)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX15:0	An unused routing information file for the controller.
Service (1)	Generic Get Attribute Single	Code for the requested service.
Class	93 or 9F (Hex.) (4)	Class ID for the DPI Parameter Object.
Instance (2)	3 (Dec.)	Instance number is the same as the parameter number.
Attribute	9 (Dec.)	Attribute number for the Parameter Value attribute.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) The instance is the parameter number in the drive (Port 0). For example, to read parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

(3) In this example, Output Current is a 32-bit parameter. If the parameter being read is a 16-bit parameter, the Size in Bytes would be set to 2. When the parameter being read is a 32-bit REAL (floating point) data type, the size in bytes would be set to 4. See the drive documentation to determine the size of the parameter and its data type (16-bit or 32-bit integer or REAL).

(4) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

MicroLogix 1100/1400 Example Get Attribute Single Response Data

In this message example, we use the data table address in Figure 6.76 to store the response value (0.13 amps) that was read from drive parameter 003 - [Output Current]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.76 Example Get Attribute Single Response Data File

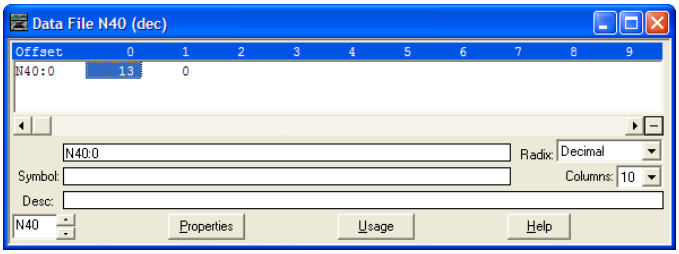


Figure 6.77 shows example ladder logic to correctly format the three possible data types for read messages in the MicroLogix 1100/1400.

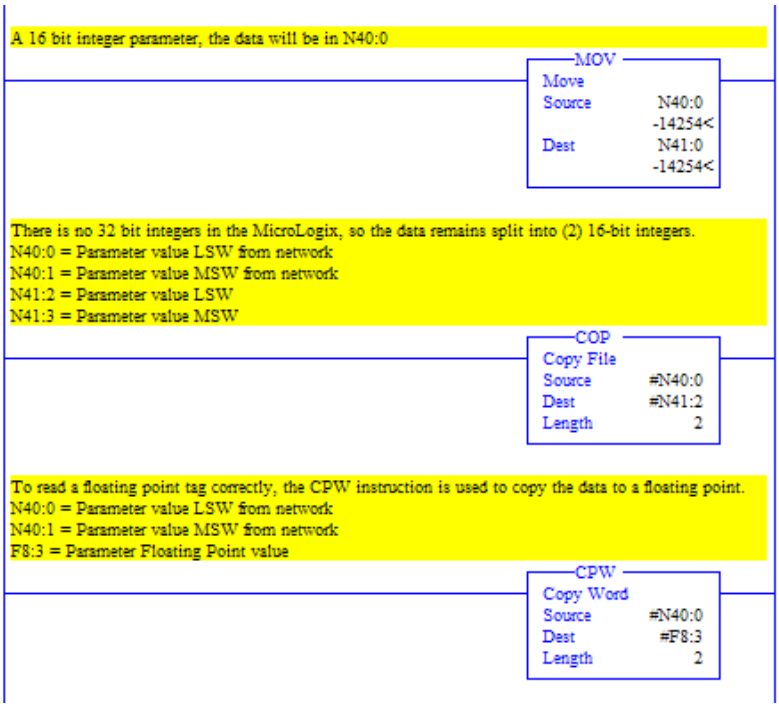
Figure 6.77 Example Ladder Logic to Format Parameter Data Types for Gets



For 16-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit Integer Parameters – All PowerFlex 7-Class Drives

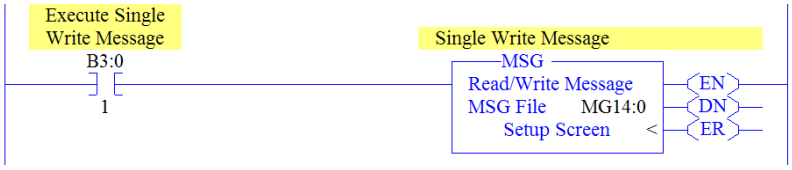
For 32-bit REAL (Floating Point) Parameters – PowerFlex 700S and PowerFlex 750-Series Drives

MicroLogix 1100/1400 Example Ladder Logic Program to Write a Single Parameter Using Generic Get/Set Attribute Service

A Generic Set Attribute Single message is used to write to a single parameter. This write message example writes a value to parameter 140 - [Accel Time 1] in a PowerFlex 7-Class drive.

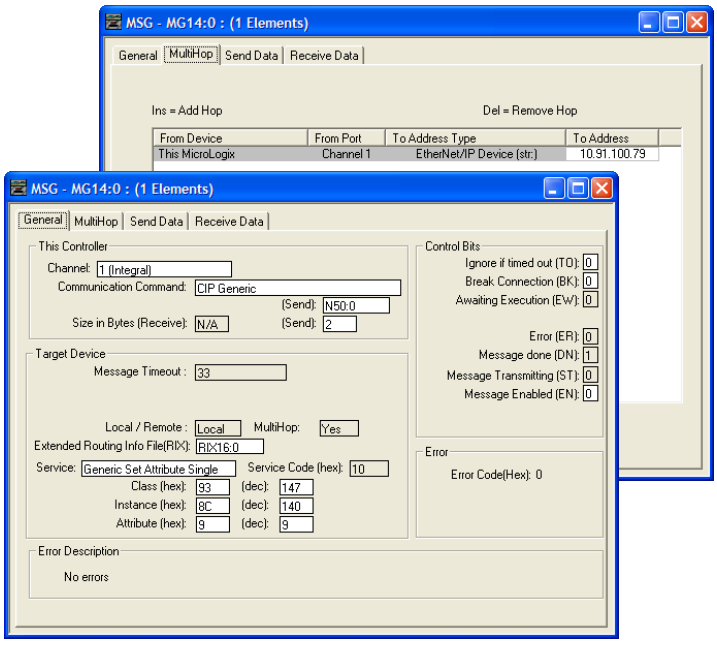
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.78 Example Ladder Logic to Write a Single Parameter



MicroLogix 1100/1400 – Formatting a Message to Write a Single Parameter Using Generic Get/Set Attribute Service

Figure 6.79 Generic Set Attribute Single Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write a single parameter.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N50:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	2 (4)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX16:0	An unused routing information file for the controller.
Service (1)	Generic Set Attribute Single	Code for the requested service.
Class	93 or 9F (Hex.) (5)	Class ID for the DPI Parameter Object.
Instance (2)	140 (Dec.)	Instance number is the same as the parameter number.
Attribute (3)	9 or 10 (Dec.)	Attribute number for the Parameter Value attribute.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) The instance is the parameter number in the drive (Port 0). For example, to write to parameter 4 of a peripheral in Port 5 of a PowerFlex 750-Series drive, the instance would be 21504 + 4 = 21508. See DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) to determine the instance number.

(3) Setting the Attribute value to “9” will write the parameter value to the drive’s Non-Volatile Storage (EEPROM) memory, so the parameter value will remain even after the drive is power cycled. **Important:** When set to “9,” be very cautious as the EEPROM may quickly exceed its life cycle and cause the drive to malfunction. Setting the Attribute value to “10” will write the parameter value to temporary memory, so the parameter value will be lost after the drive is power cycled. It is recommended to use the “10” setting when frequent write messages are required.

(4) In this example, Accel Time 1 is a 16-bit parameter. If the parameter being written to is a 32-bit parameter, the Size in Bytes would be set to 4.

(5) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

MicroLogix 1100/1400 Example Set Attribute Single Request Data

In this message example, we use the data table address in Figure 6.80 to store the request value (10.0 sec.) that was written to drive parameter 140 - [Accel Time 1]. To determine the data type for the parameter and its required scaling, refer to the specific drive documentation.

Figure 6.80 Example Set Attribute Single Request Data File

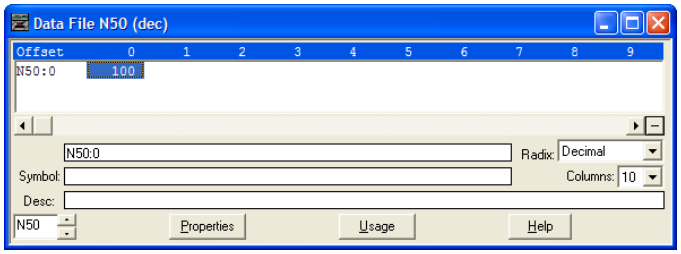


Figure 6.81 shows example ladder logic to correctly format the three possible data types for write messages in the MicroLogix 1100/1400.

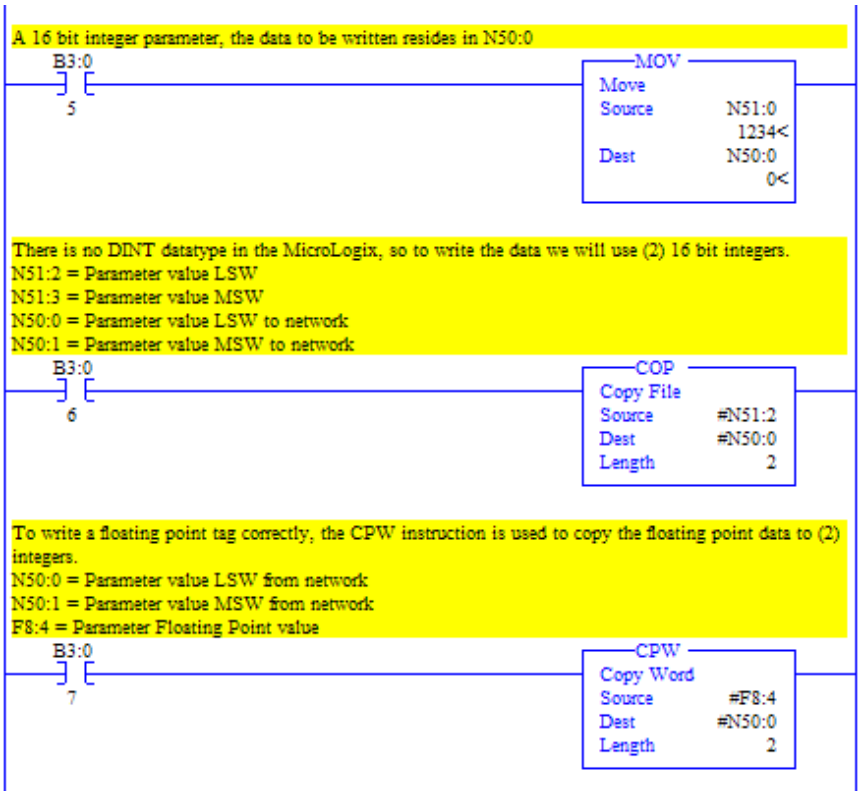
Figure 6.81 Example Ladder Logic to Format Parameter Data Types for Sets



For 16-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit Integer Parameters – All PowerFlex 7-Class Drives

For 32-bit REAL (Floating Point) Parameters – PowerFlex 700S and PowerFlex 750-Series Drives

MicroLogix 1100/1400 Example Ladder Logic Program to Read Multiple Parameters Using Generic Get/Set Attribute Service

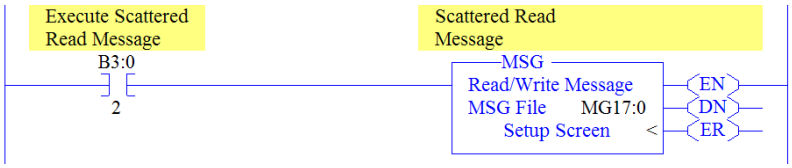
A Custom scattered read message is used to read the values of multiple parameters. This read message example reads the values of these five parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

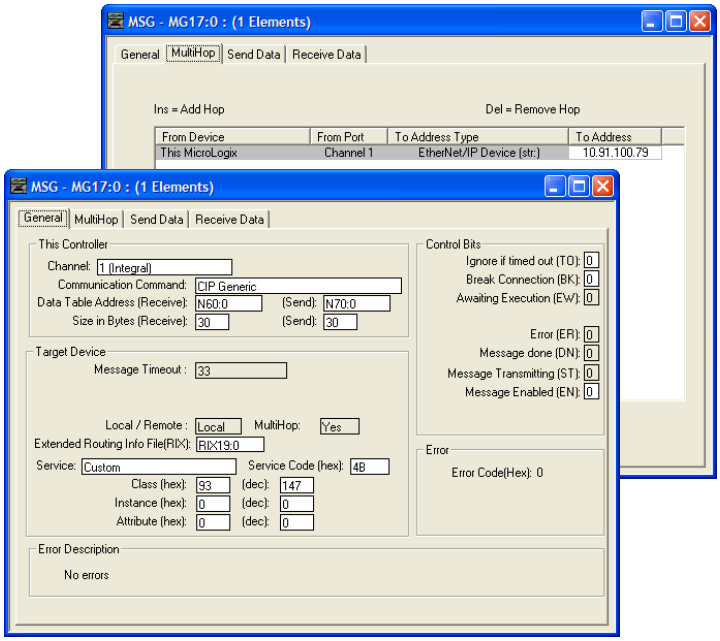
Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.82 Example Ladder Logic to Read Multiple Parameters



MicroLogix 1100/1400 – Formatting a Message to Read Multiple Parameters Using Generic Get/Set Attribute Service

Figure 6.83 Custom Scattered Read Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to read multiple parameters.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N60:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	30 (2)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX19:0	An unused routing information file for the controller.
Service (1)	Custom	Required for scattered messages.
Service Code	4B (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Dec.)	Required for scattered messages.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) In this example, we are reading five parameters. Each parameter being read requires three contiguous 16-bit words. Scattered read messages always assume that every parameter being read is a 32-bit parameter, regardless of its actual size. Therefore, the Size in Bytes must be set to 30. The data structure format is the same as shown on page 6-74. Maximum length is 66 words (132 bytes), which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

MicroLogix 1100/1400 Example Scattered Read Request Data

In this message example, we use the data table addresses in Figure 6.84 or Figure 6.85 to store the request values to be read from these drive parameters:

PowerFlex 7-Class Drive	PowerFlex 750-Series Drive
• Parameter 001 - [Output Freq] • Parameter 003 - [Output Current] • Parameter 006 - [Output Voltage] • Parameter 012 - [DC Bus Voltage] • Parameter 017 - [Analog In1 Value]	• Parameter 001 - [Output Freq] • Parameter 007 - [Output Current] • Parameter 137 - [Open Loop Fdbk] • Parameter 21581 - [Port 5: Analog Out 0 Data] • Parameter 260 - [Analog In0 Value]

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.84 Example Scattered Read Request Data File for PowerFlex 7-Class Drive

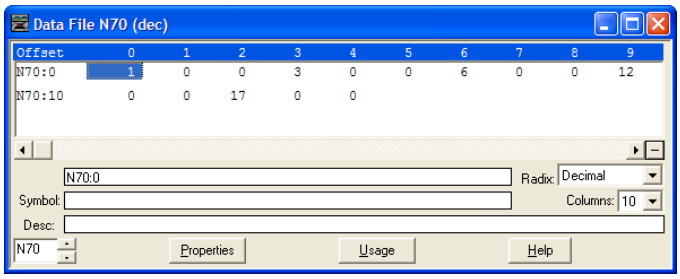


Figure 6.85 Example Scattered Read Request Data File for PowerFlex 750-Series Drive

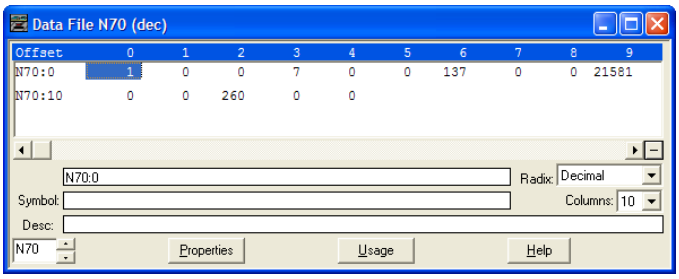
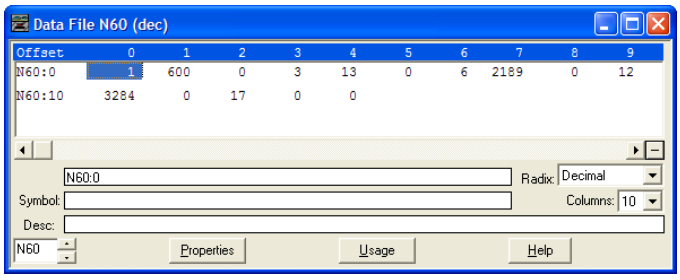


MicroLogix 1100/1400 Example Scattered Read Response Data

In this message example, we use the data table addresses in Figure 6.86 or Figure 6.87 to store the response values that were read from the requested drive parameters.

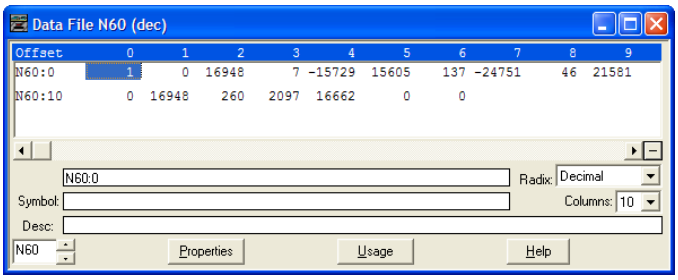
Figure 6.86 Example Scattered Read Response Data File for PowerFlex 7-Class Drive



In this example, the parameters have the following values:

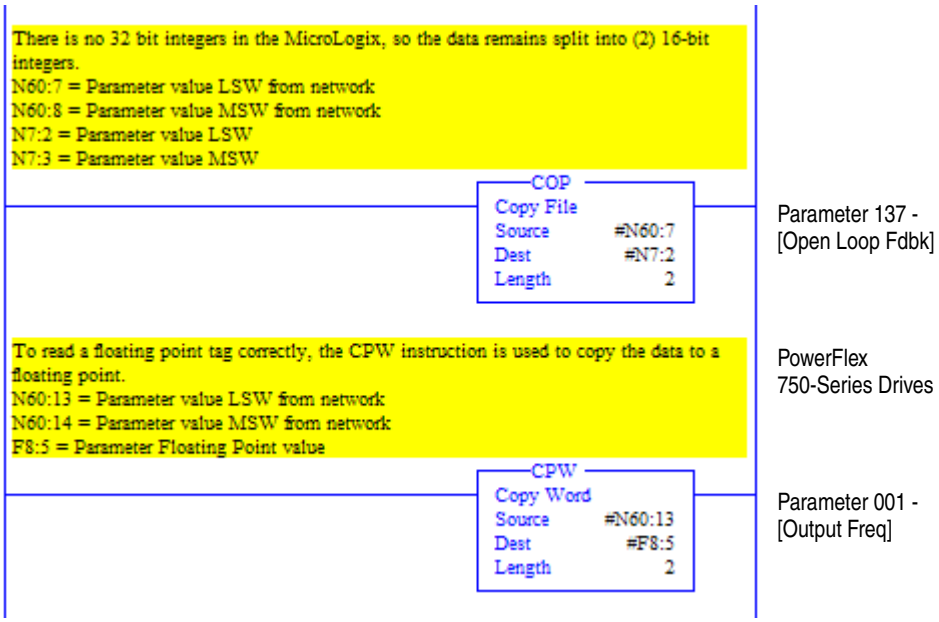
PowerFlex 7-Class Drive Parameter	Address	Read Value
1 - [Output Freq]	N60:1	32.5 Hz
3 - [Output Current]	N60:4	0.01 Amp
6 - [Output Voltage]	N60:7	118.7 VAC
12 - [DC Bus Voltage]	N60:10	329.2 VDC
17 - [Analog In2 Value]	N60:13	8.318 mA

Figure 6.87 Example Scattered Read Response Data File for PowerFlex 750-Series Drive



The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP or CPW command must be used to copy the N60 integer array to a 16-bit integer or floating tag. Figure 6.88 shows the ladder logic used for this example. If the parameter data type is a 32-bit integer, the data remains split into two 16-bit integers since there are no 32-bit integers in the MicroLogix 1100/1400. If the parameter data type is a REAL, then the destination tag is a floating point. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.88 Example Ladder Logic to Copy Response Data for PowerFlex 750-Series Drive



In this message example, the parameters have the following values:

PowerFlex 750-Series Drive Parameter	Read Value	Data Type
1 - [Output Freq]	45.0 Hz	REAL
7 - [Output Current]	0.03 Amp	REAL
137 - [Open Loop Fdbk]	3055441	DINT
21581 - [Port 5: Analog Out 0 Data]	45.0 Hz	REAL
260 - [Analog In0 Value]	9.377 Volts	REAL

MicroLogix 1100/1400 Example Ladder Logic Program to Write Multiple Parameters Using Generic Get/Set Attribute Service

A Custom scattered write message is used to write to multiple parameters. This write message example writes the following values to these five parameters:

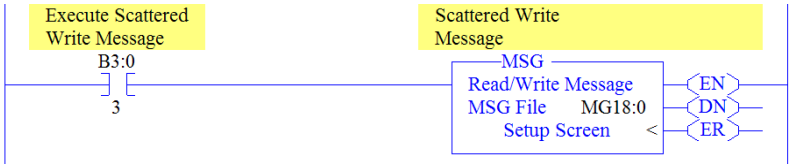
PowerFlex 7-Class Drive Parameter	Write Value
141 - [Accel Time 2]	11.1 Sec.
143 - [Decel Time 2]	22.2 Sec.
105 - [Preset Speed 5]	33.3 Hz.
106 - [Preset Speed 6]	44.4 Hz.
107 - [Preset Speed 7]	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value
536 - [Accel Time 2]	11.1 Sec.
538 - [Decel Time 2]	22.2 Sec.
725 - [Zero Position]	33
21555 - [Port 5: Analog In0 Hi]	5.5
780 - [PTP Setpoint]	-75,555

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

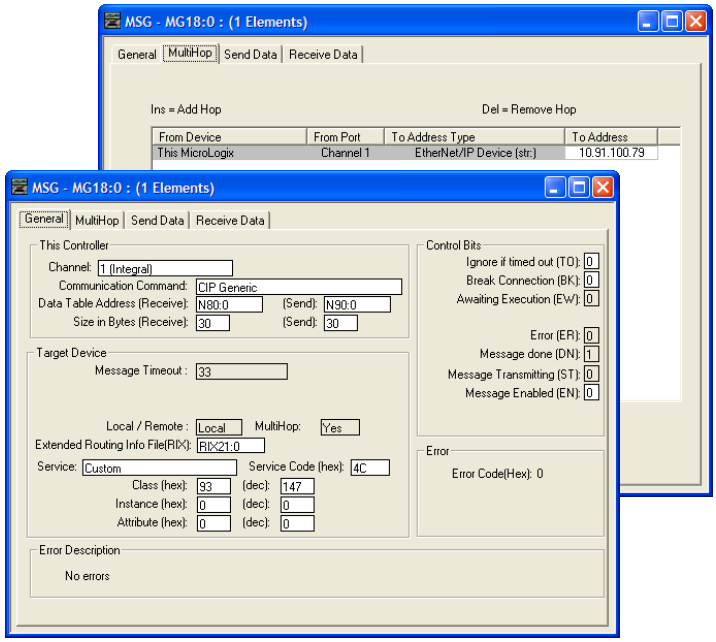
Figure 6.89 Example Ladder Logic to Write Multiple Parameters



Important: If the explicit message scattered write must be written continuously, then use a separate Generic Set service explicit message single write for each parameter using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F and attribute A (10 decimal; see page 6-64). Attribute A writes to RAM—not NVS (EEPROM) memory. This example scattered write message using attribute 0 writes to NVS. Over time, continuous writes will exceed the EEPROM life cycle and cause the drive to malfunction.

MicroLogix 1100/1400 – Formatting a Message to Write Multiple Parameters Using Generic Get/Set Attribute Service

Figure 6.90 Custom Scattered Write Multiple Message Configuration Screens



The following table identifies the data that is required in each box to configure a message to write multiple parameters.

General Tab	Example Value	Description
Channel	1	Controller port to which the network is connected.
Comm… Command	CIP Generic	Used to access the Parameter Object in the adapter.
Data Table Address	N80:0	An unused controller data table address containing the message instruction. This address is the starting word of the destination file.
Size in Bytes	30 (2)	Number of bytes to be transferred. Each byte size is an 8-bit integer.
Extended Routing…	RIX21:0	An unused routing information file for the controller.
Service (1)	Custom	Required for scattered messages.
Service Code	4C (Hex.)	Code for the requested service.
Class	93 or 9F (Hex.) (3)	Class ID for the DPI Parameter Object.
Instance	0 (Dec.)	Required for scattered messages.
Attribute	0 (Dec.)	Required for scattered messages.
MultiHop Tab	**Example Value**	**Description**
To Address	10.91.100.79	IP address of the adapter connected to the drive.

(1) The default setting for Service is “Custom,” enabling entry of a Service Code not available from the Service pull-down menu. When choosing a Service other than “Custom” from the pull-down menu, an appropriate Hex. value is automatically assigned to the Service Code box which is dimmed (unavailable).

(2) In this example, we are writing to five parameters. Each parameter being written to requires three contiguous 16-bit words. Scattered write messages always assume that every parameter being written to is a 32-bit parameter, regardless of its actual size. Therefore, the Size in Bytes must be set to 30. The data structure format is the same as shown on page 6-18. Maximum length is 66 words (132 bytes), which equates to 22 parameters. For parameter numbering, see DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F).

(3) See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using DPI Parameter Object Class code 0x93 or Host DPI Parameter Object Class code 0x9F for explicit messaging.

MicroLogix 1100/1400 Example Scattered Write Request Data

In this message example, we use the data table addresses in Figure 6.91 to store the request values to be written to these drive parameters:

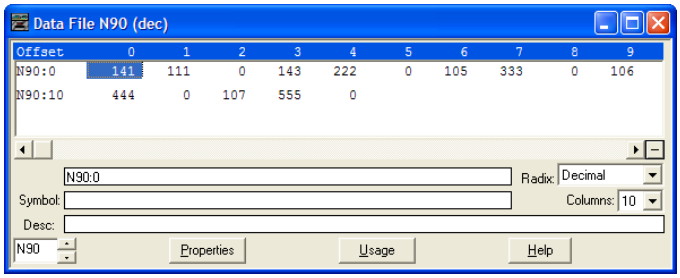
PowerFlex 7-Class Drive Parameter	Address	Write Value
141 - [Accel Time 2]	N90:1	11.1 Sec.
143 - [Decel Time 2]	N90:4	22.2 Sec.
105 - [Preset Speed 5]	N90:7	33.3 Hz.
106 - [Preset Speed 6]	N90:10	44.4 Hz.
107 - [Preset Speed 7]	N90:13	55.5 Hz.

PowerFlex 750-Series Drive Parameter	Write Value	Data Type
536 - [Accel Time 2]	11.1 Sec.	REAL
538 - [Decel Time 2]	22.2 Sec.	REAL
725 - [Zero Position]	33	32-bit integer
21555 - [Port 5: Analog In0 Hi]	5.5	REAL
780 - [PTP Setpoint]	-75,555	32-bit integer

Refer to DPI Parameter Object on page C-16 (Class code 0x93) or Host DPI Parameter Object on page C-30 (Class code 0x9F) for parameter numbering.

Figure 6.91 or Figure 6.94 shows the parameter values.

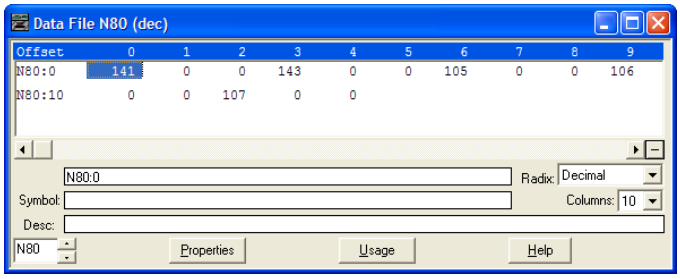
Figure 6.91 Example Scattered Write Request Data File for PowerFlex 7-Class Drive



MicroLogix 1100/1400 Example Scattered Write Response Data

In this message example, we use the data table addresses in Figure 6.92 to store the response values that were written to the requested drive parameters. Values of “0” indicate no errors occurred.

Figure 6.92 Example Scattered Write Response Data File for PowerFlex 7-Class Drive



The PowerFlex 750-Series drive uses 32-bit integer and REAL parameters. A COP or CPW command must be used to copy the 16-bit integer or REAL values to the N90 integer array. Figure 6.93 shows the ladder logic used for this example. If the parameter data type is a 32-bit integer, the data remains

split into two 16-bit integers since there are no 32-bit integers in the MicroLogix 1100/1400. If the parameter data type is a REAL, then the source tag is a floating point. See the drive documentation to determine the parameter data type (32-bit integer or REAL).

Figure 6.93 Example Ladder Logic to Copy Request Data for PowerFlex 750-Series Drive

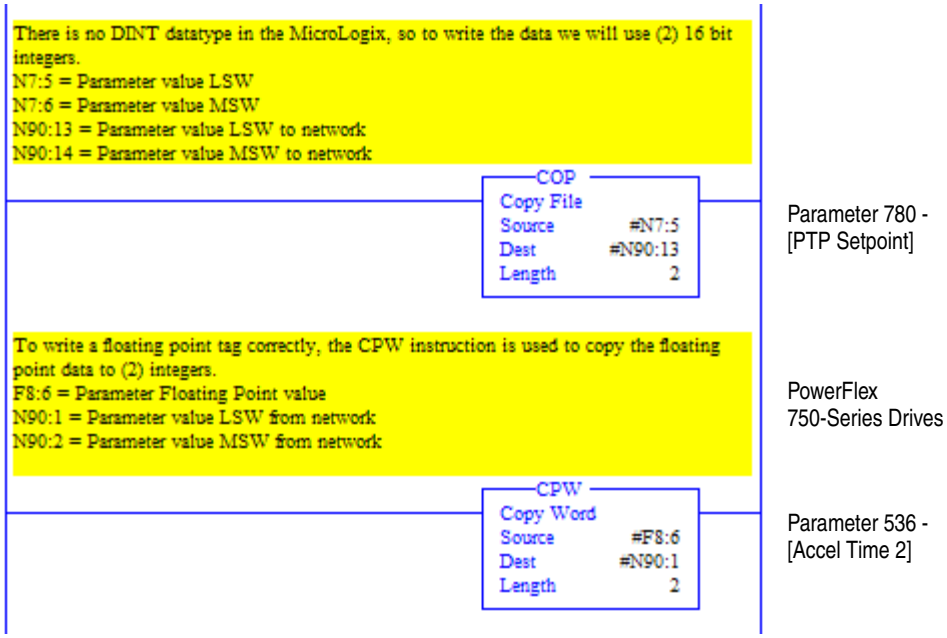


Figure 6.94 Example Scattered Write Request Data File for PowerFlex 750-Series Drive

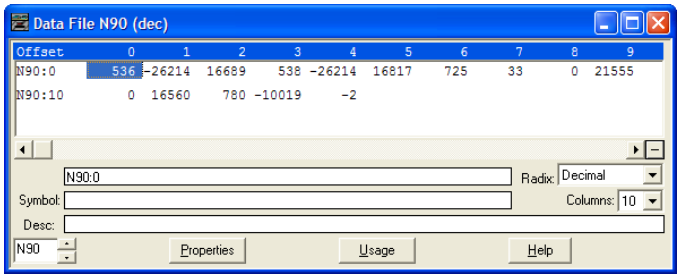
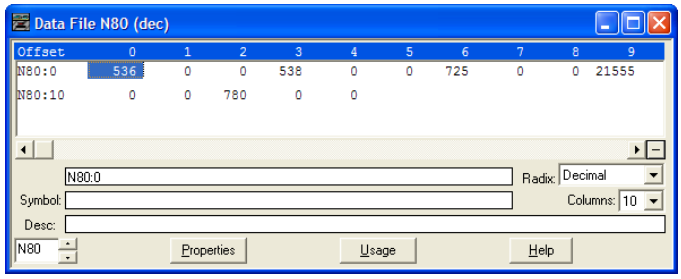


The results of the explicit message appear in the destination tag array N80 (Figure 6.63). Values of “0” indicate no errors occurred.

Figure 6.95 Example Scattered Write Response Data File for PowerFlex 750-Series Drive



MicroLogix 1100/1400 – Explanation of Request and Response Data for Read/Write Multiple Messaging

The data structures in Figure 6.96 and Figure 6.97 use 16-bit words and can accommodate up to 22 parameters in a single message. In the Response Message, a parameter number with the high bit set indicates that the associated parameter value field contains an error code (parameter number in response data will be negative).

Important: See Table 6.A on page 6-2 for limitations of PowerFlex 7-Class and PowerFlex 750-Series drives when using Class code 0x93 or Class code 0x9F for explicit messaging.

Figure 6.96 Data Structures for Scattered Read Messages

	Request (Source Data)		Response (Destination Data)

Troubleshooting

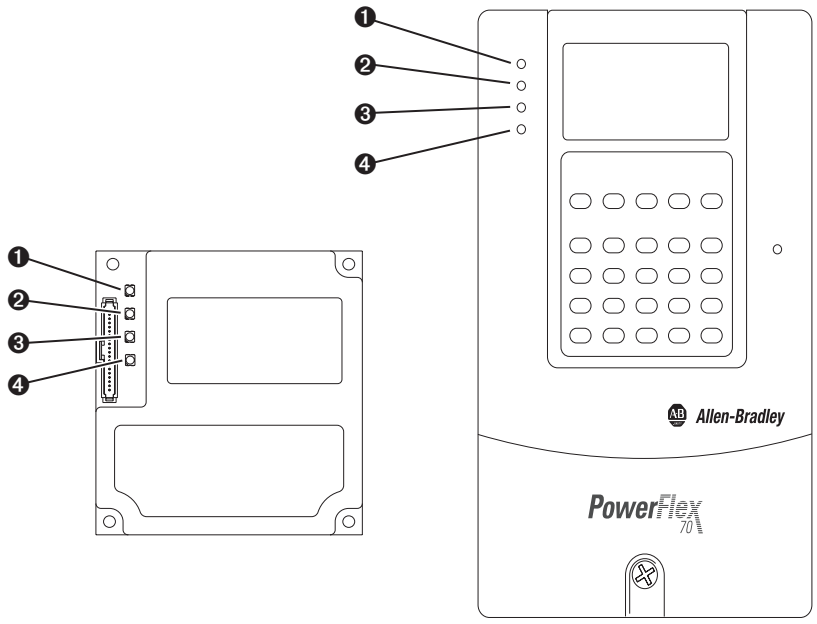
This chapter provides information for diagnosing and troubleshooting potential problems with the adapter and network.

Topic	Page
Understanding the Status Indicators	7-1
PORT Status Indicator	7-2
MOD Status Indicator	7-2
NET A Status Indicator	7-3
NET B Status Indicator	7-3
Viewing Adapter Diagnostic Items	7-4
Viewing and Clearing Events	7-6

Understanding the Status Indicators

The adapter has four status indicators. They can be viewed on the adapter or through the drive cover. See Figure 7.1.

Figure 7.1 Status Indicators (location on drive may vary)



Item	Status Indicator	Description	Page
1	PORT	DPI Connection Status	7-2
2	MOD	Adapter Status	7-2
3	NET A	EtherNet/IP Connection Status	7-3
4	NET B	EtherNet/IP Transmit Status	7-3

PORT Status Indicator

This red/green bicolor LED indicates the status of the adapter's connection to the drive as shown in the table below.

Status	Cause	Corrective Action
Off	The adapter is not powered or is not properly connected to the drive.	• Securely connect the adapter to the drive using the Internal Interface (ribbon) cable. • Apply power to the drive (or adapter if mounted in a DPI External Comms Kit).
Flashing Red	The adapter is not receiving a ping message from the drive.	• Verify that cables are securely connected and not damaged. Replace cables if necessary. • Cycle power to the drive (or adapter if mounted in a DPI External Comms Kit).
Steady Red	The drive has refused an I/O connection from the adapter. Another DPI peripheral is using the same DPI port as the adapter.	**Important:** Cycle power to the drive (or adapter if mounted in a DPI External Comms Kit) after making any of the following corrections: • Verify that all DPI cables on the drive are securely connected and not damaged. Replace cables if necessary. • Verify that the DPI drive supports Datalinks. • Configure the adapter to use a Datalink that is not already being used by another peripheral.
Steady Orange	The adapter is connected to a product that does not support Allen-Bradley DPI communications.	Connect the adapter to a product that supports Allen-Bradley DPI communications (for example, a PowerFlex 7-Class drive).
Flashing Green	The adapter is establishing an I/O connection to the drive.	No action required. Normal behavior if no DPI I/O is enabled.
Steady Green	The adapter is properly connected and is communicating with the drive.	No action required.

MOD Status Indicator

This red/green bicolor LED indicates the status of the adapter as shown in the table below.

Status	Cause	Corrective Action
Off	The adapter is not powered or is not properly connected to the drive.	• Securely connect the adapter to the drive using the Internal Interface (ribbon) cable. • Apply power to the drive (or adapter if mounted in a DPI External Comms Kit).
Flashing Red	The adapter has failed the firmware test. The adapter is being flash upgraded.	• Clear faults in the adapter. • Cycle power to the drive (or adapter if mounted in a DPI External Comms Kit). • If cycling power does not correct the problem, the adapter parameter settings may have been corrupted. Reset defaults and reconfigure the adapter. • If resetting defaults does not correct the problem, flash the adapter with the latest firmware release.
Steady Red	The adapter has failed the hardware test.	• Cycle power to the drive (or adapter if mounted in a DPI External Comms Kit). • Replace the adapter.
Flashing Green	The adapter is operational, but is not transferring I/O data to a controller.	• Place the scanner in RUN mode. • Program the controller to recognize and transmit I/O to the adapter. • Configure the adapter for the program in the controller. • Normal behavior if no DPI I/O is enabled.
Steady Green	The adapter is operational and transferring I/O data to a controller.	No action required.

NET A Status Indicator

This red/green bicolor LED indicates the status of the network connection as shown in the table below.

Status	Cause	Corrective Actions
Off	The adapter is not powered, the adapter is not properly connected to the network, the adapter needs an IP address, or BOOTP is enabled.	• Securely connect the adapter to the drive using the Internal Interface (ribbon) cable and to the network using an Ethernet cable. • Correctly connect the Ethernet cable to the Ethernet connector. • Set a unique IP address and disable BOOTP using a BOOTP server, or set a unique IP address by using adapter parameters. • Apply power to the drive (or adapter if mounted in a DPI External Comms Kit).
Steady Red	The adapter failed the duplicate IP address detection test.	Configure the adapter to use a unique IP address and cycle power.
Flashing Red	An EtherNet/IP connection has timed out.	• Place the scanner in RUN mode, or apply power to the peer device that will send I/O. • Check the IGMP Snooping/Ethernet Switches for correct operation. • Check the amount of traffic on the network.
Flashing Red/Green	The adapter is performing a self-test.	No action required.
Flashing Green	The adapter is properly connected, has an IP address, and is connected to an EtherNet/IP network but does not have an I/O connection.	• Place the controller in RUN mode, or apply power to the peer device that will send I/O. • Program the controller or peer device to recognize and transmit I/O or make a messaging connection to the adapter. • Configure the adapter for the program in the controller or the I/O from the peer device.
Steady Green	The adapter is properly connected and communicating on the network to a controller.	No action required.

NET B Status Indicator

This green LED indicates the status of the adapter transmitting on the network as shown in the table below.

Status	Cause	Corrective Actions
Off	The adapter is not powered or is not transmitting on the network.	If NET A indicator is off: • Securely connect the adapter to the drive using the Internal Interface (ribbon) cable and to the network using an Ethernet cable. • Correctly connect the Ethernet cable to the Ethernet connector. • Set a unique IP address using a BOOTP server or by disabling BOOTP and using adapter parameters. If NET A indicator is steady red: • Configure the adapter to use a unique IP address and cycle power. If NET A indicator is flashing red/green or red: • Check the IP address in the adapter and scanner, and verify that the controller can communicate with the adapter. • Ping the adapter. Normal condition if the adapter is idle.
Flashing Green	The adapter is properly connected, BOOTP is enabled, and the adapter is transmitting data packets on the network.	No action required.

Viewing Adapter Diagnostic Items

If you encounter unexpected communications problems, the adapter's diagnostic items may help you or Rockwell Automation personnel troubleshoot the problem. Adapter diagnostic items can be viewed using an LCD PowerFlex 7-Class HIM (Diagnostics/Device Items), DriveExplorer software (version 2.01 or later), or DriveExecutive software (version 3.01 or later).

Using the HIM to View Adapter Diagnostic Items

Step	Example Screen
1. Access parameters in the adapter. Refer to Using the PowerFlex 7-Class HIM on page 3-2. 2. Press the ▲ or ▼ key to scroll to **Diagnostics**. 3. Press the ↵ (Enter) key to display the Diagnostics menu in the adapter. 4. Repeat steps 2 and 3 to enter the **Device Items** option. 5. Press the ▲ or ▼ key to scroll through the items.	Main Menu: Diagnostics Parameter Device Select Device Item # 3 Reference

Table 7.A Adapter Diagnostic Items

No.	Name	Description
1	Common Logic Cmd	The present value of the Common Logic Command being transmitted to the drive by this adapter.
2	Prod Logic Cmd	The present value of the Product Logic Command being transmitted to the drive by this adapter from the controller.
3	Reference	The present value of the Reference being transmitted to the drive by this adapter. Note that a 16-bit value will be sent as the Most Significant Word of the 32-bit field.
4	Common Logic Sts	The present value of the Common Logic Status being received from the drive by this adapter.
5	Prod Logic Sts	The present value of the Product Logic Status being received from the drive by this adapter to the controller.
6	Feedback	The present value of the Feedback being received from the drive by this adapter. Note that a 16-bit value will be sent as the Most Significant Word of the 32-bit field.
7	Datalink A1 In	The present value of respective Datalink In being transmitted to the drive by this adapter. (If not using a Datalink, this parameter should have a value of zero.)
8	Datalink A2 In	
9	Datalink B1 In	
10	Datalink B2 In	
11	Datalink C1 In	
12	Datalink C2 In	
13	Datalink D1 In	
14	Datalink D2 In	
15	Datalink A1 Out	The present value of respective Datalink Out being received from the drive by this adapter. (If the drive indicates a 16-bit datalink size, the value appears in the least significant 16 bits of this diagnostic item, and the most significant 16 bits of this diagnostic item are zero.)
16	Datalink A2 Out	
17	Datalink B1 Out	
18	Datalink B2 Out	
19	Datalink C1 Out	
20	Datalink C2 Out	
21	Datalink D1 Out	
22	Datalink D2 Out	
23	DPI Rx Errors	The present value of the DPI Receive error counter.
24	DPI Rx Error Max	The maximum value (since reset) of the DPI Receive error counter.
25	DPI Tx Errors	The present value of the DPI Transmit error counter.

Table 7.A Adapter Diagnostic Items (Continued)

No.	Name	Description
26	DPI Tx Error Max	The maximum value (since reset) of the DPI Transmit error counter.
27	Boot Flash Count	Number of times the boot firmware in the adapter has been flash updated.
28	App Flash Count	Number of times the application firmware in the adapter has been flash updated.
29	M-S Input Size	Size of data transferred from the network to the drive.
30	M-S Output Size	Size of data transferred from the drive to the network.
31 32 33 34 35 36	HW Addr 1 HW Addr 2 HW Addr 3 HW Addr 4 HW Addr 5 HW Addr 6	Decimal value of each byte in the adapter's Ethernet hardware address. 255 : 255 : 255 : 255 : 255 : 255 [HW Addr 1] [HW Addr 2] [HW Addr 3] [HW Addr 4] HW Addr 5] [HW Addr 6]
37 38 39 40	IP Addr Act 1 IP Addr Act 2 IP Addr Act 3 IP Addr Act 4	Value of each byte in the adapter's present IP address. A value of "0" appears if the adapter does not currently have an IP address. 255 . 255 . 255 . 255 [IP Addr Act 1] [IP Addr Act 2] [IP Addr Act 3] [IP Addr Act 4]
41 42 43 44	Subnet Act 1 Subnet Act 2 Subnet Act 3 Subnet Act 4	Value of each byte in the adapter's present subnet mask. A value of "0" appears if the adapter does not currently have a subnet mask. 255 . 255 . 255 . 255 [Subnet Act 1] [Subnet Act 2] [Subnet Act 3] [Subnet Act 4]
45 46 47 48	Gateway Act 1 Gateway Act 2 Gateway Act 3 Gateway Act 4	Value of each byte in the adapter's present gateway address. A value of "0" appears if the adapter does not currently have a gateway address. 255 . 255 . 255 . 255 [Gateway Act 1] [Gateway Act 2] [Gateway Act 3] [Gateway Act 4]
49	EN Rx Overruns	Number of receive buffer overruns reported by the Ethernet hardware.
50	EN Rx Packets	Number of Ethernet packets that the adapter has received.
51	EN Rx Errors	Number of receive errors reported by the Ethernet hardware.
52	EN Tx Packets	Number of Ethernet packets that the adapter has sent.
53	EN Tx Errors	Number of transmit errors reported by the Ethernet hardware.
54	Last TCP Reset	Last reason that the adapter reset or rejected a TCP/IP connection.
55	Missed IO Pkts	Number of incoming I/O connection packets that the adapter did not receive.
56	OPT Status	Operating status of optional I/O board in DPI External Comms Kit. For the meanings of the individual bits, see Viewing Optional I/O Diagnostic Items on page 9-4.
57	OPT RX Errors	Number of optional I/O board receive errors.
58	OPT FW Version	Firmware version of optional I/O board (in DPI External Comms Kit).

Viewing and Clearing Events

The adapter has an event queue to record significant events that occur in the operation of the adapter. When such an event occurs, an entry is put into the event queue. You can view the event queue using an LCD PowerFlex 7-Class HIM, DriveExplorer (version 2.01 or later) software, DriveExecutive (version 1.01 or later) software or other clients using the DPI Fault object.

The event queue can contain up to 32 entries. Eventually the event queue will become full, since its contents are retained through adapter resets. At that point, a new entry replaces the oldest entry. Only an event queue clear operation or adapter power cycle will clear the event queue contents.

Resetting the adapter to defaults has no effect on the event queue.

Using the HIM to View and Clear Events

Step	Example Screen
Viewing Events	
1. Access parameters in the adapter. Refer to Using the PowerFlex 7-Class HIM on page 3-2.	
2. Press the ▲ or ▼ key to scroll to **Diagnostics**.	3. Press the ↵ (Enter) key to display the Diagnostics menu in the adapter.	
4. Repeat steps 2 and 3 to enter the **Events** option and then **View Event Queue** option.	
5. Press the ▲ or ▼ key to scroll through events. The most recent event is Event 1.	Clearing Events	
1. Access parameters in the adapter. Refer to Using the PowerFlex 7-Class HIM on page 3-2.	
2. Press the ▲ or ▼ key to scroll to **Diagnostics**.	
3. Press the ↵ (Enter) key to display the Diagnostics menu in the adapter.	
4. Repeat steps 2 and 3 to enter the **Events** option and then the **Clear Event** option or **Clr Event Queue** option. A message will pop up to confirm that you want to clear the message or queue.	
5. Press the ↵ (Enter) key to confirm your request. If **Clr Event Queue** was selected, all event queue entries will then display "No Event."	
Events

Many events in the event queue occur under normal operation. If you encounter unexpected communications problems, the events may help you or Allen-Bradley personnel troubleshoot the problem. The following events may appear in the event queue:

Table 7.B Adapter Events

Code	Event	Description
1	No Event	Empty event queue entry.
2	DPI Bus Off Flt	A bus-off condition was detected on DPI. This event may be caused by loose or broken cables or by noise.
3	Ping Time Flt	A ping message was not received on DPI within the specified time.
4	Port ID Flt	The adapter is not connected to a correct port on a DPI product.
5	Port Change Flt	The DPI port changed after start up.
6	Host Sent Reset	The drive sent a reset event message.
7	EEPROM Sum Flt	The EEPROM in the adapter is corrupt.
8	Online @ 125kbps	The adapter detected that the drive is communicating at 125 kbps.
9	Online @ 500kbps	The adapter detected that the drive is communicating at 500 kbps.
10	Bad Host Flt	The adapter was connected to an incompatible product.
11	Dup Port Flt	Another peripheral with the same port number is already in use.
12	Type 0 Login	The adapter has logged in for Type 0 control.
13	Type 0 Time Flt	The adapter has not received a Type 0 status message within the specified time.
14	DL Login	The adapter has logged into a Datalink.
15	DL Reject Flt	The drive rejected an attempt to log in to a Datalink because the Datalink is not supported or is used by another peripheral.
16	DL Time Flt	The adapter has not received a Datalink message within the specified time.
17	Reserved	Not used.
18	Control Disabled	The adapter has sent a “Soft Control Disable” command to the drive.
19	Control Enabled	The adapter has sent a “Soft Control Enable” command to the drive.
20	Message Timeout	A Client-Server message sent by the adapter was not completed within 1 sec.
21	Flt Cfg Error	One of the Flt Cfg xx parameters is set to a value greater than 65535 and the drive requires a 16-bit value.
22	App Updated	Startup sequence detected new application firmware.
23	EN Comm Flt	The adapter detected a communications fault on the network.
24	EN Sent Reset	The adapter received a reset from the network.
25	EN Close Flt	An I/O connection from the network to the adapter was closed.
26	EN Idle Flt	The adapter is receiving “idle” packets from the network.
27	EN Open	An I/O connection from the network to the adapter has been opened.
28	EN Timeout Flt	An I/O connection from the network to the adapter has timed out.
29	PCCC IO Close	The device sending PCCC Control messages to the adapter has set the PCCC Control Timeout to zero.
30	PCCC IO Open	The adapter has begun receiving PCCC control messages (the PCCC Control Timeout was previously set to a non-zero value).
31	PCCC IO Time Flt	The adapter has not received a PCCC Control message for longer than the PCCC Control Timeout.
32	Watchdog T/O Flt	The software detects a failure.
33	EEPROM Init	Startup sequence detected a blank EEPROM map revision.
34	Normal Startup	The adapter successfully started up.
35	Manual Reset	The adapter was reset by changing its Reset Module parameter.
36	EN Link Down	The Ethernet link was removed from the adapter.
37	EN Link Up	An Ethernet link is available for the adapter.
38	BOOTP Response	The adapter received a response to its BOOTP request.
39	Dup IP Addr	The adapter uses the same IP address as another device on the network.
40	Peer IO Open	The adapter received the first Peer I/O message.
41	Peer IO Time Flt	The adapter has not received a Peer I/O message for longer than the Peer I/O Timeout.

Table 7.B Adapter Events (Continued)

Code	Event	Description
42	Email Failed	The adapter encountered an error attempting to send a requested e-mail message.
43	Msg Ctrl Open	The timeout attribute in either the CIP Register or Assembly object was written with a non-zero value, allowing control messages to be sent to the adapter.
44	Msg Ctrl Close	The timeout attribute in either the CIP Register or Assembly object was written with a zero value, disallowing control messages to be sent to the adapter.
45	Msg Ctrl Timeout	The timeout attribute in either the CIP Register or Assembly object elapsed between accesses of those objects.
46	OPT Open	The adapter began exchanging I/O data with the I/O option of the DPI External Comms Kit.
47	OPT Close	The adapter forced a fault condition on the I/O option of the DPI External Comms Kit.
48	OPT Timeout	Communication between the adapter and I/O option of the DPI External Comms Kit was disrupted.

Viewing the Adapter's Web Pages

This chapter provides instructions on how to monitor the adapter and connected PowerFlex drive by using the adapter's web interface.

Topic	Page
Accessing the Adapter's Web Home Page	8-1
Process Display Pop-up Window	8-4
TCP/IP Configuration Web Page	8-5
Configure E-mail Notification Web Page	8-6
DPI Device Information Pages	8-9

Future enhancements may result in adapter web pages that look different than the examples shown in this chapter.

Accessing the Adapter's Web Home Page

After configuring the adapter, you can view its web pages. These pages present information about the adapter, the drive to which it is connected, and the other DPI devices connected to the drive such as a HIM.

TIP: Series A adapter web pages are enabled differently than Series B.

- Series A adapter (version 2.003 or earlier)—By default the adapter web pages are enabled. To disable the web pages, use Bit 0 of **Parameter 54 - [Access Control]**. Refer to Setting Web Access Control on page 3-16 for more information.
- Series B adapter (version 3.xxx or later)—By default the adapter web pages are disabled. To enable the web pages, set the Web Pages Switch (SW2 in Figure 2.1) to its "Enable Web" position and reset the adapter. **Parameter 55 - [Web Enable]** can be used to display the setting (Enabled or Disabled) of this switch.

The adapter can be configured to automatically send e-mail messages to desired addresses when selected drive faults occur and/or are cleared, and/or when the adapter takes a communication or idle fault action.

For Series A adapters, Bit 1 of **Parameter 54 - [Access Control]** can be used to protect the configured settings for the e-mail messaging feature. For Series B adapters, Bit 0 of **Parameter 56 - [Web Features]** can be used to protect the configured settings. For more details, see Configure E-mail Notification Web Page on page 8-6.

Viewing the Web Pages of the Adapter

1. On a computer with access to the EtherNet/IP network on which the adapter/drive is installed, launch a web browser such as Microsoft™ Internet Explorer (version 5.0 or later).

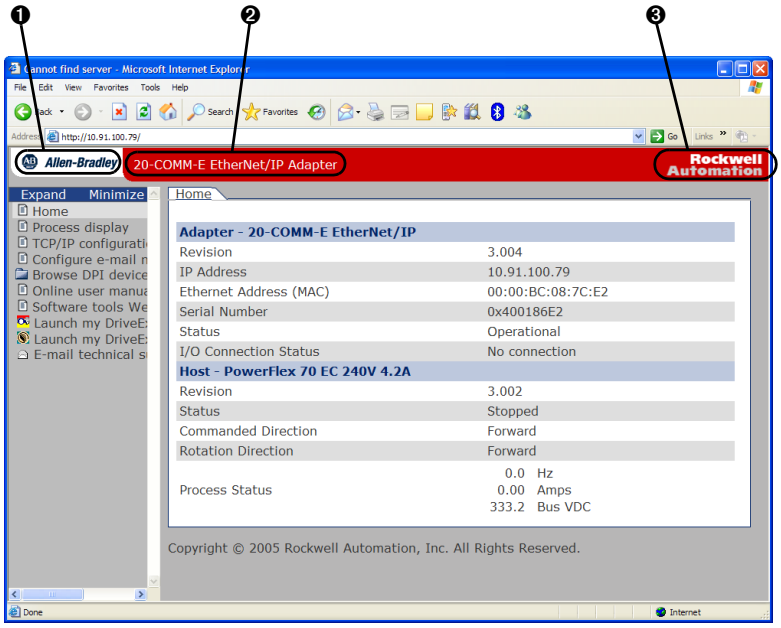
   The computer can access the adapter web pages if it is connected to:

   - The same network as the adapter.
   - A network with access to the adapter's network via a gateway device (for example, a router).

2. In the Address box, type the IP address of the adapter, and then press ENTER. The adapter web Home Page (Figure 8.1) should appear.

   Important: Using the browser's View > Refresh function will always re-display the adapter Home Page while viewing any of the adapter's other web pages.

Figure 8.1 Adapter Web Home Page Example



Title Bar on Adapter Web Pages

The title bar appears on the adapter Home Page and all of the adapter's other web pages. The title bar consists of three elements as shown in Figure 8.1:

Title Bar Element	Description
❶ Allen-Bradley logo	This logo is a hyperlink. Click it to view the ab.com web Home Page.
❷ Adapter Title	Shows the adapter type or user-configurable title.
❸ Rockwell Automation logo	This logo is a hyperlink. Click it to view the Rockwell Automation web Home Page.

Navigation Menu on Adapter Web Pages

The navigation menu appears on the left side of the adapter Home Page and all of the adapter's other web pages. The navigation menu consists of links and link folders which can be expanded or minimized. The following table shows all navigation menu links and link folders.

Table 8.A Navigation Menu Links and Link Folders

Link/Folder	Description
Home link	Click this link to view the adapter's Home Page (Figure 8.1).
Process Display link	Click this link to view the host drive's Process Display pop-up window (Figure 8.2).
TCP/IP configuration link	Click this link to view the adapter's TCP/IP Configuration web page showing information about the TCP/IP configuration, such as the adapter's IP address and the number of packets being sent. Figure 8.3 shows an example TCP/IP Configuration web page.
Configure e-mail notification link	Click this link to view the adapter's Configure E-mail Notification web page (Figure 8.4) to configure the adapter to send automatic e-mail messages. E-mail notification can accommodate specific needs such as when only selected faults occur (Figure 8.5). An example e-mail message is shown in Figure 8.7.
Browse DPI devices folder	Click this folder to expand and view the Port folders for all present DPI devices, including the drive, adapter, and other DPI devices connected to the drive such as a HIM.
Port x folders	Click a respective Port folder to expand and view its device's various links which take you to related information pages. For Port 0 (PowerFlex 70 Drive) example information pages, see Figure 8.8, Figure 8.9, and Figure 8.10.
Online user manuals link	Click this link to view Rockwell Automation's web page with documentation for drives and other devices.
Software tools Web site link	Click this link to view Allen-Bradley's web page with information about software tools such as DriveExplorer and DriveExecutive.
Launch my DriveExplorer software link	Click this link to launch the DriveExplorer software already installed on your PC.
Launch my DriveExecutive software link	Click this link to launch the DriveExecutive software already installed on your PC.
E-mail technical support link	Click this link to view a new e-mail message window to send a message to Allen-Bradley's Technical Support Team.

Information on Adapter Home Page

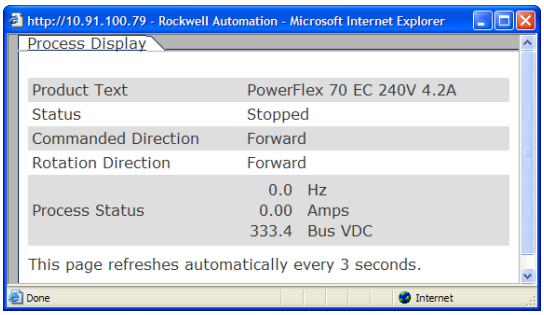
The adapter Home Page displays the following information for the adapter and its host drive:

Information for	Description
Adapter	• Revision • IP Address • Ethernet Address (MAC) • Serial Number • Status • I/O Connection Status
Host "X" Drive	• Revision • Status • Commanded Direction • Rotation Direction • Process Status

Process Display Pop-up Window

The Process Display pop-up window dynamically shows the host drive's information. To view this window, click the "Process display" link in the navigation menu.

Figure 8.2 Example of Process Display Pop-up Window

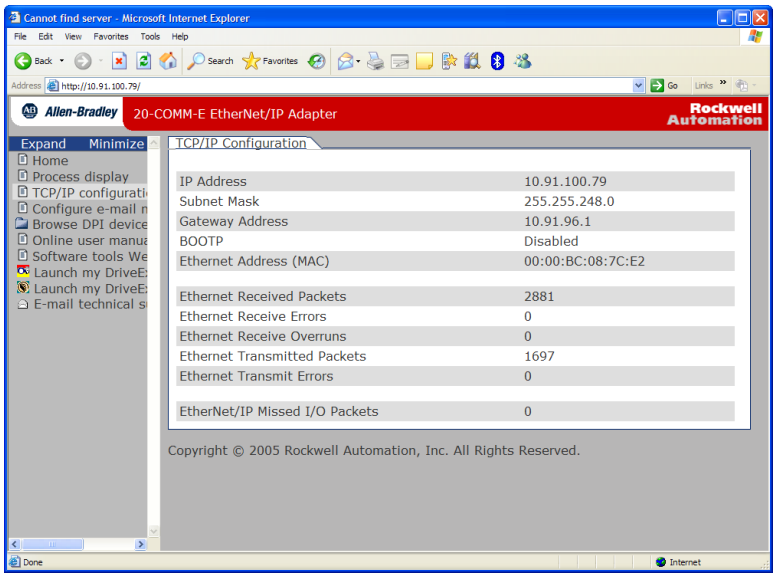


Information	Description
Product Text	Description of host drive.
Status	Status of host drive.
Commanded Direction	Commanded direction of host drive.
Rotation Direction	Rotation direction of host drive.
Process Status 1st Line Lines 2 and 3	 Dynamic value of the host drive feedback parameter (not selectable). Dynamic value of each default displayed host drive parameter (selectable). (Line 2 and 3 default displayed host drive parameters can be changed using a HIM, DriveExecutive software or DriveExplorer software.)

TCP/IP Configuration Web Page

The TCP/IP Configuration web page provides information about the adapter's Ethernet settings and network activities. To view this web page, click the "TCP/IP configuration" link (highlighted in Figure 8.3) in the navigation menu.

Figure 8.3 Example of TCP/IP Configuration Web Page

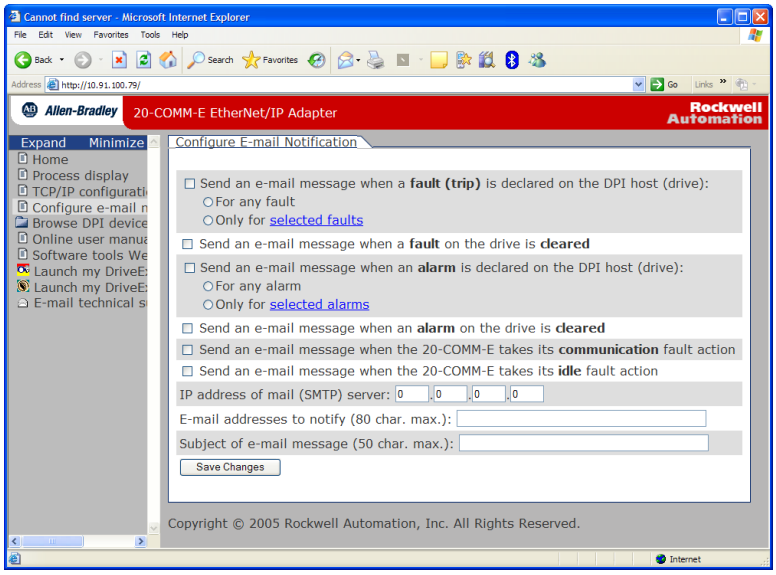


Information	Description
IP Address	IP address of the adapter.
Subnet Mask	Subnet mask for the adapter's network.
Gateway Address	Address for the gateway device on the adapter's network.
BOOTP	Shows status for BOOTP, which may be used to configure the adapter's network information.
Ethernet Address (MAC)	Hardware address for the adapter.
Ethernet Received Packets	Number of packets that the adapter has received.
Ethernet Receive Errors	Number of receive errors reported by the hardware.
Ethernet Receive Overruns	Number of receive buffer overruns reported by the hardware.
Ethernet Transmitted Packets	Number of packets that the adapter has sent.
Ethernet Transmit Errors	Number of transmit errors reported by the hardware.
EtherNet/IP Missed I/O Packets	Number of I/O connection packets that the adapter did not receive.

Configure E-mail Notification Web Page

The Configure E-mail Notification web page contains selections and data fields for configuring the adapter to automatically send e-mail messages to desired addresses when selected types of events occur. To view this web page, click the "Configure e-mail…" link (highlighted in Figure 8.4) in the navigation menu.

Figure 8.4 Example of Configure E-mail Notification Web Page



E-mail configuration for Series A adapters is enabled and disabled differently than Series B adapters.

- Series A adapters (version 2.003 or earlier)—By default, settings are protected and the user needs to enable configuration by using **Parameter 54 - [Access Control]** to set the E-mail Config Bit 1 value to "1" (Enabled). After configuration, settings can be protected by changing the E-mail Config Bit 1 value back to "0" (Disabled).

- Series B adapters (version 3.xxx or later)—By default, settings are not protected. After configuration, settings can be protected by using **Parameter 56 - [Web Features]** to set E-mail Cfg Bit 0 value to "0" (Disabled). To change a protected configuration, it must first be unprotected by setting the E-mail Cfg Bit 0 value back to "1" (Enabled).

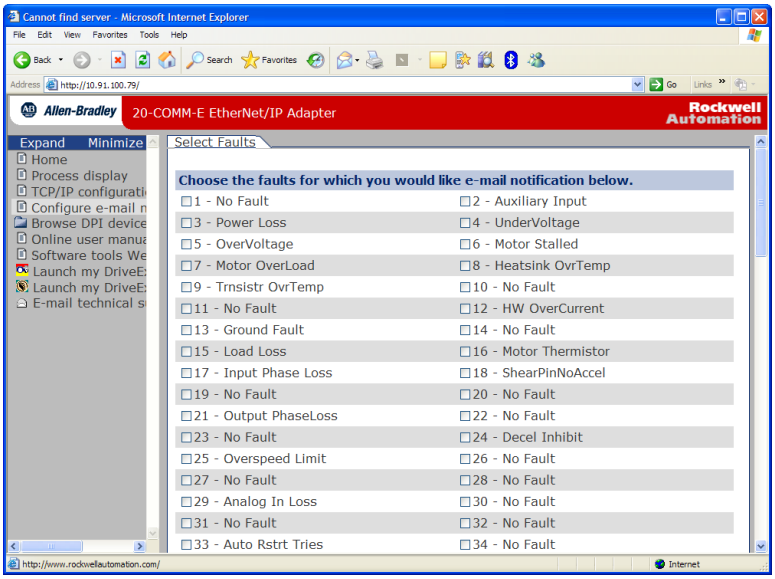
To configure e-mail notification:

1. Click the desired "Send an e-mail message when…" check boxes you want to occur that will send e-mail notification. If you only want e-mail notification when selected faults/alarms occur:

   A. Click the respective fault and/or alarm radio buttons.

   B. Click the "selected faults" link and/or "selected alarms" link. Figure 8.5 shows an example faults configuration page.

Figure 8.5 Example of Selected Faults Configuration Page



C. Click the desired fault/alarm check boxes, and click **Save Changes**.

D. Click the "Back to E-mail Configuration Page" link.

2. Type the following information in their respective boxes:

Information	Description
"IP address of..."	Type in the address of the mail server that will be used to deliver the e-mail messages. (When the IP address is unknown, read the TIP shown below this table to determine the mail server address.)
"E-mail addresses to notify..."	Type in addresses to where you want e-mail messages to be sent. Multiple addresses can be used, but they must be separated by commas (comma delimited).
"Subject of e-mail message..."	Type in the desired subject text for the e-mail message.

TIP: If the IP address of the e-mail server is unknown, you can contact your IT department or use the following DOS command instructions to find its IP address:

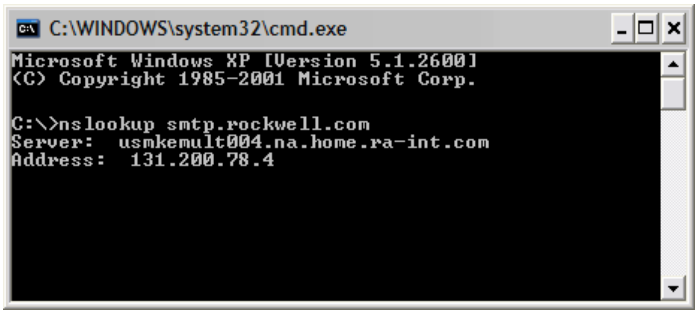
A. On the Windows task bar, click **Start > Run** to display the Run window.

B. In the Run window Open field, type "cmd" and click **OK** to display the DOS window.

C. On the c:\ > command line, type "nslookup [name of e-mail server]." The entry "c:\ > nslookup smtp.company.com" is an example.

D. Press **ENTER** to display the e-mail server IP address (Figure 8.6).

Figure 8.6 DOS Window Example Showing E-mail Server IP Address



The IP address shown in the DOS window (for this example, 131.200.78.4) should be typed into the E-mail Notification Web Page shown in Figure 8.4.

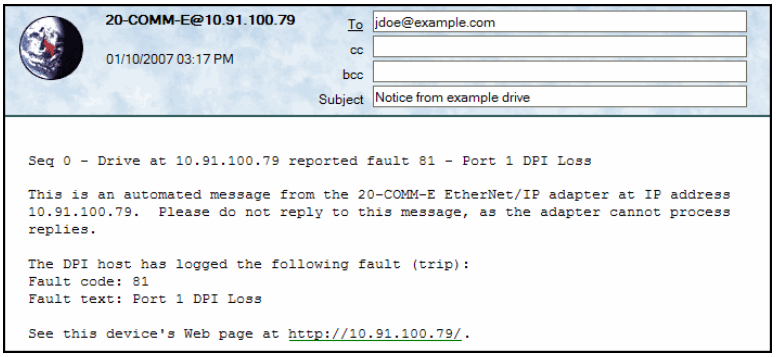
3. Click **Save changes**.

Important: After configuring E-mail Notification, it is recommended to protect the settings. Otherwise the configuration can be changed anytime the web page is accessed with a browser. To protect the settings:

- Series A Adapters—Use **Parameter 54 - [Access Control]** to set E-mail Config Bit 1 value to "0" (Disabled).
- Series B Adapters—Use **Parameter 56 - [Web Features]** to set E-mail Cfg Bit 0 value to "0" (Disabled).

Figure 8.7 shows an example e-mail message automatically sent by the adapter in response to selected events.

Figure 8.7 Example of E-mail Message Sent by Adapter



TIP: To stop e-mail messages, uncheck all of the "Send an e-mail message when…" boxes.

- For Series A adapters, disabling the adapter web pages by using **Parameter 54 - [Access Control]** to set the Web Enable Bit 0 value to "0" (Disabled) will NOT stop the adapter from sending e-mail messages.
- For Series B adapters, disabling the adapter web pages by setting the Web Pages Switch (SW2 in Figure 2.1) to the "Disable Web" position will NOT stop the adapter from sending e-mail messages.

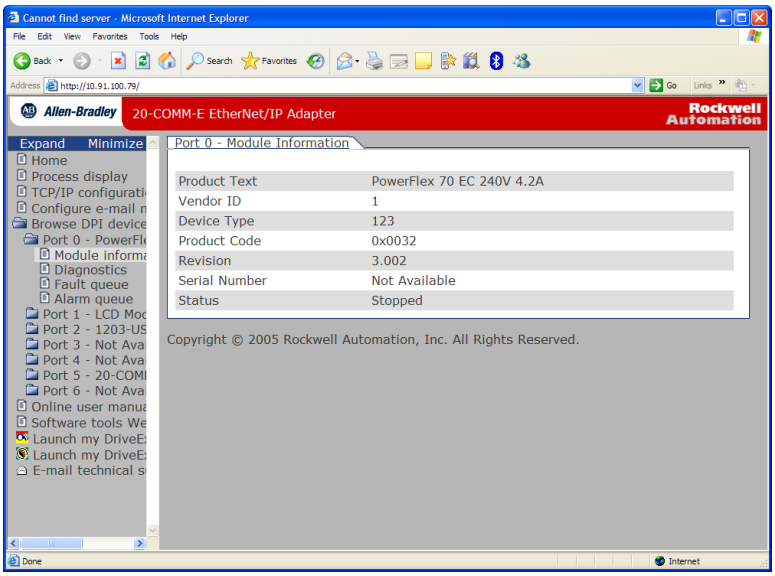
DPI Device Information Pages

DPI device information pages are viewed by clicking on the respective links in the navigation menu:

Web Page	Description
Module Information	Shows module information for the respective Port device. For example, Figure 8.8 shows module information for the Port 0 device (host drive).
Diagnostic Items	Shows diagnostic item information for the respective Port device. For example, Figure 8.9 shows diagnostic items for the Port 0 device (host drive).
Fault Queue	Shows fault queue information for the respective Port device. For example, Figure 8.10 shows the fault queue for the Port 0 device (host drive).
Alarm Queue (1)	Shows alarm queue information for the respective Port device. For example, Figure 8.11 shows the alarm queue for the Port 0 device (host drive).
Event Queue (1)	Shows event queue information for the respective Port device. For example, Figure 8.12 shows the event queue for the Port 5 device (22-COMM-E adapter).

(1) Information shown only when supported by the device.

Figure 8.8 Example of Port 0 (PowerFlex 70 Drive) Module Information Page



Information	Description
Product Text	Text identifying the device
Vendor ID	1 = Allen-Bradley
Device Type	123
Product Code	Code for the product name and its rating
Revision	Firmware revision used by the device
Serial Number	Serial number of the device
Status	Operating status of the device (for example, faulted)

Figure 8.9 Example of Port 0 (PowerFlex 70 Drive) Diagnostic Items Page

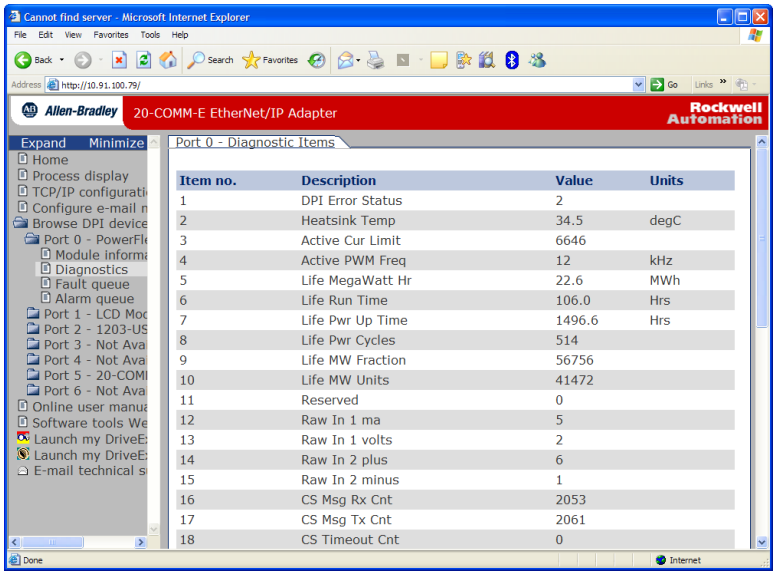


Figure 8.10 Example of Port 0 (PowerFlex 70 Drive) Fault Queue Page

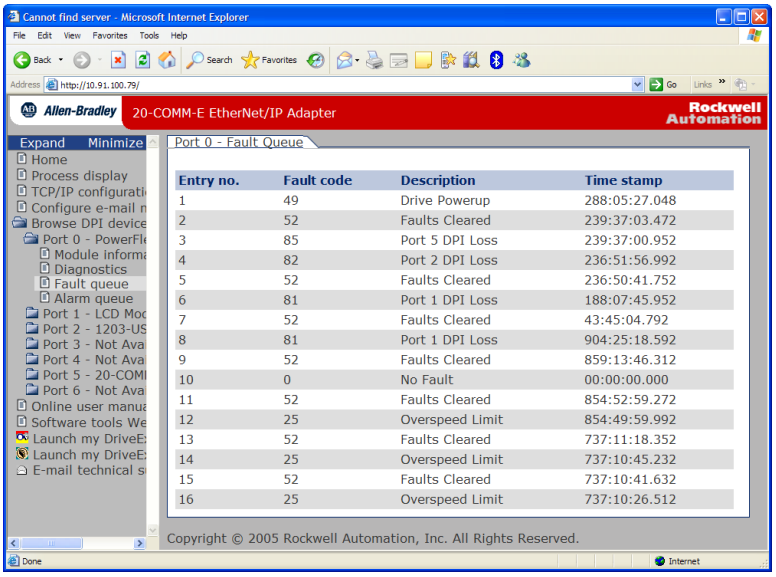

NOTE: For drives that do not support an alarm queue, the adapter will still display an alarm queue web page (Figure 8.11), but show that the alarm queue is not available.

Figure 8.11 Example of Port 0 (PowerFlex 70 Drive) Alarm Queue Page

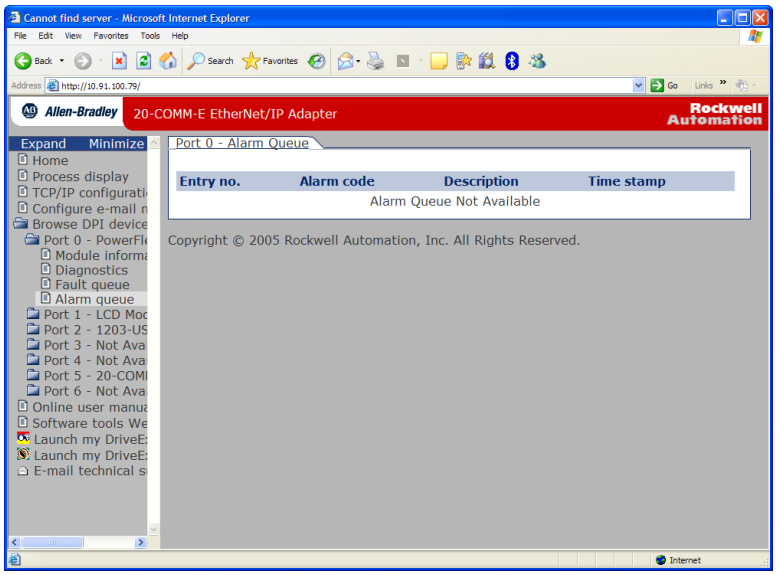

Figure 8.12 shows an example event queue page for the Port 5 device (20-COMM-E adapter).

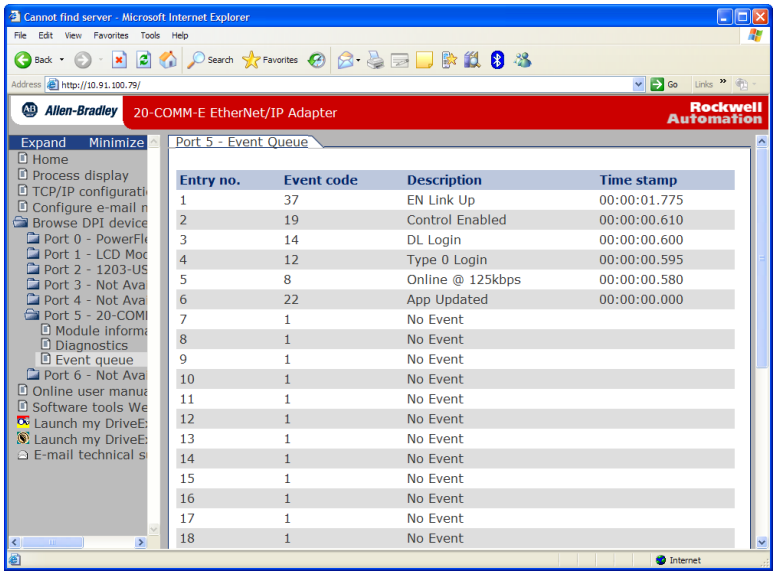
Figure 8.12 Example of Port 5 (20-COMM-E Adapter) Event Queue Page



Notes:

Using the Adapter in a DPI External Comms Kit (20-XCOMM-DC-BASE)

This chapter provides information and examples that explain how to use the adapter in a DPI External Comms Kit (20-XCOMM-DC-BASE).

The adapter is typically installed in the internal communication slot on the PowerFlex 7-Class drive. However, an externally-mounted adapter may be desired when:

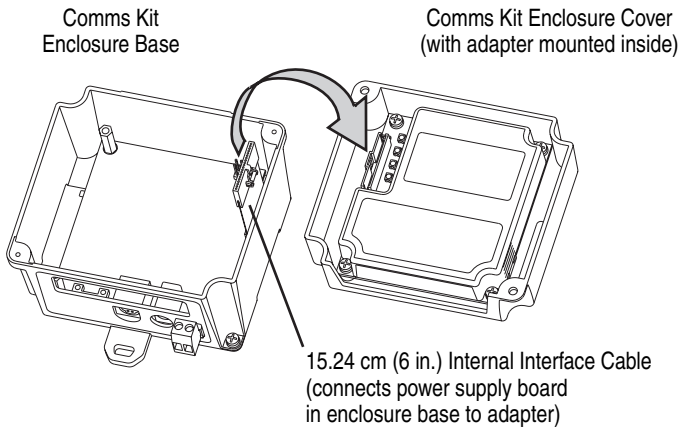
- The PowerFlex drive is already connected to an existing network, such as Remote I/O, and a second network is desired for software tools (DriveExplorer, DriveExecutive, etc.), data collection, etc.
- The PowerFlex drive is remotely located next to some I/O devices that also need to be networked. The DPI External Comms Kit has an option slot for general-purpose network I/O that a controller can use. Both the drive and I/O devices are handled as one node on the network to reduce the network node count.

Topic	Page
Installing the Adapter	9-1
I/O Board Option (20-XCOMM-IO-OPT1)	9-2
Understanding the I/O Image (Drive + I/O Option)	9-2
Configuring the Adapter to Use the Optional I/O Data	9-3
Viewing Optional I/O Diagnostic Items	9-4

Installing the Adapter

The adapter can be installed in a DPI External Comms Kit.

Figure 9.1 Mounting and Connecting the Adapter

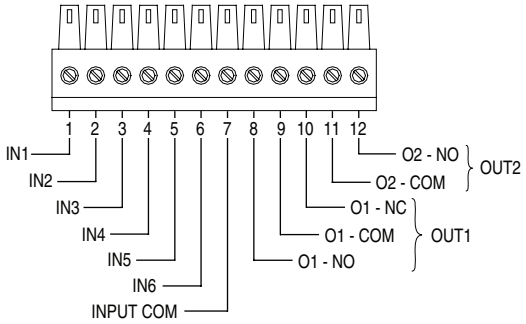


For more information, refer to the *DPI External Communications Kit Installation Instructions* (publication 20COMM-IN001).

I/O Board Option (20-XCOMM-IO-OPT1)

The I/O Board option, when installed in the DPI External Comms Kit, can be used with the adapter (Series B, firmware version 3.xxx or later required). The I/O Board provides (6) DC inputs and (2) Relay outputs for use by a controller on the network.

Figure 9.2 I/O Connector Function Descriptions

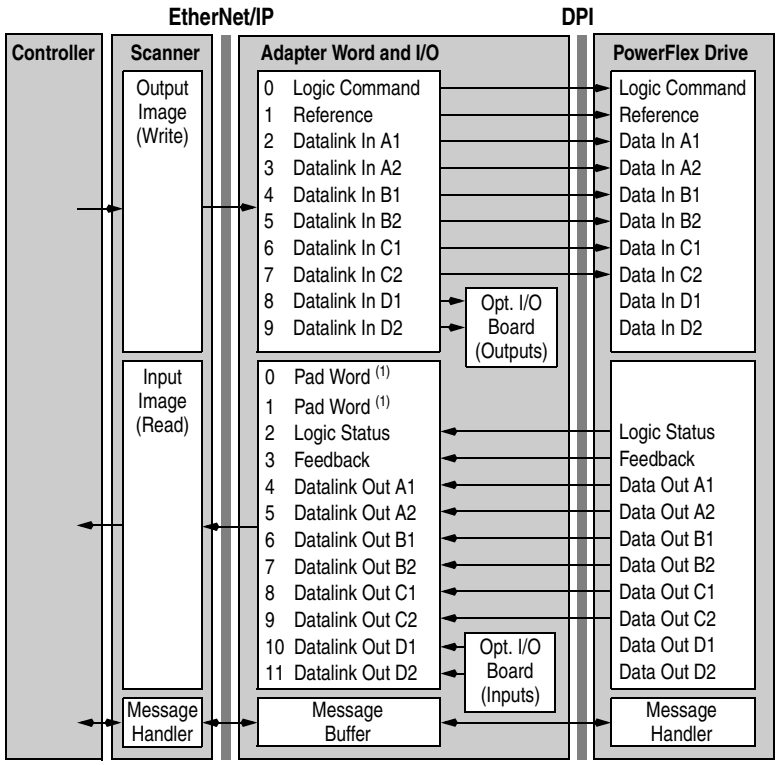


For more information, refer to the *I/O Board Option Installation Instructions* (publication 20COMM-IN002).

Understanding the I/O Image (Drive + I/O Option)

The data for the optional I/O Board is sent over the I/O connection using Datalink D. When the optional I/O Board is installed in the DPI External Comms Kit, Datalink D is dedicated for this function only and is not available for other uses. When the adapter detects the presence of the optional I/O Board, the I/O image is modified as shown in Figure 9.3.

Figure 9.3 Example I/O Image – Datalink D Dedicated to I/O Board and All I/O Enabled



(1) Required by ControlLogix when using the Generic Profile. May or may not be required by other types of controllers.

The data from the I/O Board is loaded into the Datalink word starting with bit 0 of Datalink D1 and concluding with bit 14. Bit 15 of Datalink D1 is reserved as an input valid Status flag. When the input data is valid, bit 15 = 1.

For example, for the 20-XCOMM-IO-OPT1, the digital inputs and digital outputs are mapped as shown in Figure 9.4 and Figure 9.5 respectively.

Figure 9.4 I/O Board Option Digital Input Mapping

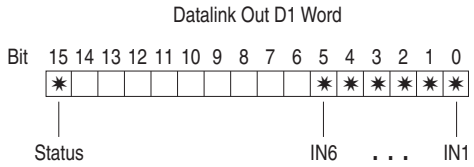


Figure 9.5 I/O Board Option Digital Output Mapping

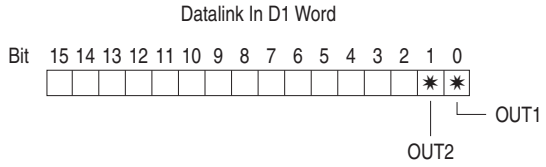

Important: On power-up or reset, the outputs will be in a "non-activated" state.

Configuring the Adapter to Use the Optional I/O Data

To configure the adapter to use the optional I/O Board, **Parameters 23 - [DPI I/O Cfg]**, **35 - [M-S Input]**, and **36 - [M-S Output]** must be set. To send input/output data from the optional I/O board to the network:

- Turn on bit 4 ("1xxxx") in **Parameter 35 - [M-S Input]**.
- Turn on bit 4 ("1xxxx") in **Parameter 36 - [M-S Output]**.
- Turn off bit 4 ("0xxxx") in **Parameter 23 - [DPI I/O Cfg]**.

Setting the Datalink D bit 4 in the M-S Input and M-S Output parameters directs the communication adapter to send Datalink D back to the controller. Turning off bit 4 in the DPI I/O Cfg parameter directs the communication adapter to not send Datalink D data back to the drive. For more information on I/O Messaging and Configuring Datalinks, see Chapter 5, Using the I/O.

If the I/O Board Fault Action Jumper (JMP1) is set to the Fault Configurable position, **Parameter 33 - [Flt Cfg D1 In]** is used to set the states of the outputs when the I/O Board takes its Fault Action. For details on setting the Fault Action Jumper, see the *I/O Board Option Installation Instructions* (publication 20COMM-IN002).

Viewing Optional I/O Diagnostic Items

Viewing communication adapter diagnostic item 56 (OPT Status) shows the operating status of the optional I/O board:

Bit	State	Status Indication	Description
0	1 (On)	OPT Present	I/O data is being exchanged with the adapter.
1	1 (On)	OPT Faulted	The I/O board is taking its fault action.
2	1 (On)	Hold Last	Fault Action is “Hold Last.”
3	1 (On)	Send Flt Cfg	Fault Action is “Fault Config.”

Viewing communication adapter diagnostic item 57 (OPT RX Errors) shows the number of I/O board receive errors.

Viewing communication adapter diagnostic item 58 (OPT FW Version) shows the present firmware version of the optional I/O board.

Diagnostic item 13 (Datalink D1 In) will show the status of the outputs as a combined decimal value. For example, a “0” decimal (“00” binary) indicates both outputs are off and a “3” decimal (“11” binary) indicates both outputs are on. **NOTE:** A status bit is not used for outputs.

Diagnostic item 21 (Datalink D1 Out) will show the status of the inputs as a combined decimal value, including the status bit 15. For example, Figure 9.6 shows inputs that are valid and all on, and Figure 9.7 shows inputs that are valid and all off (zero).

Figure 9.6 Valid Inputs All On

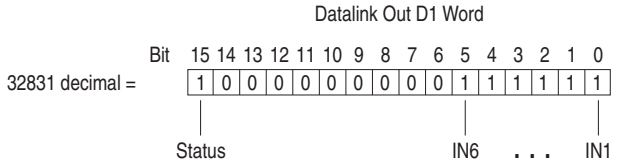

Figure 9.7 Valid Inputs All Off

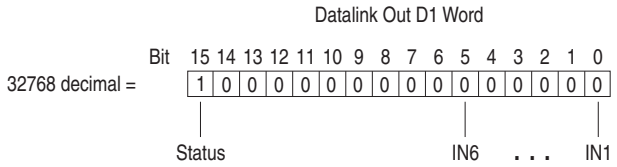

Specifications

Appendix A presents the specifications for the adapter.

Topic	Page
Communications	A-1
Electrical	A-1
Mechanical	A-2
Environmental	A-2
Regulatory Compliance	A-2

Communications

Network	
Protocol	EtherNet/IP
Data Rates	10 Mbps Full Duplex 10 Mbps Half Duplex 100 Mbps Full Duplex 100 Mbps Half Duplex
Connection Limits	30 TCP connections 16 simultaneous CIP connections including 1 exclusive-owner I/O connection The following activities use a CIP connection: • Class I I/O connections (for example, from a ControlLogix controller) • Explicit messaging where “connected” is chosen (for example, in a checkbox in RSLogix 5000) • DriveExecutive connections to the drive The following activities DO NOT use a CIP connection: • Explicit messaging-based control using PCCC or the Register or Assembly objects, including the PLC-5, SLC 500, and MicroLogix 1100 examples in Chapter 4 • Explicit messaging where “connected” is NOT chosen, which is typically the default • DriveExplorer connections to the drive
Requested Packet Interval (RPI)	5 ms minimum
Packet Rate	Up to 400 total I/O packets per second (200 in and 200 out)
Drive	
Protocol	DPI
Data Rates	125 kbps or 500 kbps

Electrical

Consumption	
Drive	350 mA at 5 VDC supplied by the host (drive or DPI External Comms Kit)
Network	None

Mechanical

Dimensions	
Height	19 mm (0.75 inches)
Length	86 mm (3.39 inches)
Width	78.5 mm (3.09 inches)
Weight	85 g (3 oz.)

Environmental

Temperature	
Operating	-10…50°C (14…122°F)
Storage	-40…85°C (-40…185°F)
Relative Humidity	5…95% non-condensing
Atmosphere	**Important:** The adapter **must not** be installed in an area where the ambient atmosphere contains volatile or corrosive gas, vapors or dust. If the adapter is not going to be installed for a period of time, it must be stored in an area where it will not be exposed to a corrosive atmosphere.

Regulatory Compliance

Certification	Specification
UL	UL508C
cUL	CAN / CSA C22.2 No. 14-M91
CE	EN50178 and EN61800-3
CTick	EN61800-3

NOTE: This is a product of category C2 according to IEC 61800-3. In a domestic environment this product may cause radio interference in which case supplementary mitigation measures may be required.

Adapter Parameters

Appendix B provides information about the adapter parameters.

Topic	Page
About Parameter Numbers	B-1
Parameter List	B-1

About Parameter Numbers

The parameters in the adapter are numbered consecutively. However, depending on which configuration tool you use, they may have different numbers.

Configuration Tool	Numbering Scheme
• HIM • DriveExplorer • DriveExecutive	The adapter parameters begin with parameter 01. For example, **Parameter 01 - [DPI Port]** is parameter 01 as indicated by this manual.
• Explicit Messaging	Refer to Chapter 6, Using Explicit Messaging and Appendix C, EtherNet/IP Objects for details.

Parameter List

Parameter No.	Name and Description	Details
01	**[DPI Port]** Displays the port to which the adapter is connected. This will usually be port 5.	Default: 5 Minimum: 0 Maximum: 7 Type: Read Only
02	**[DPI Data Rate]** Displays the data rate used by the drive. This data rate is set in the drive and the adapter detects it.	Default: 0 = 125 kbps Values: 0 = 125 kbps 1 = 500 kbps Type: Read Only
03	**[BOOTP]** Configures the adapter to use BOOTP so that you can set its IP address, subnet mask, and gateway address with a BOOTP server.	Default: 1 = Enabled Values: 0 = Disabled 1 = Enabled Type: Read/Write Reset Required: Yes
04 05 06 07	**[IP Addr Cfg 1]** **[IP Addr Cfg 2]** **[IP Addr Cfg 3]** **[IP Addr Cfg 4]** Sets the bytes in the IP address. 255 . 255 . 255 . 255 [IP Addr Cfg 1] [IP Addr Cfg 2] [IP Addr Cfg 3] [IP Addr Cfg 4] **Important:** To set the IP address using these parameters, **Parameter 03 - [BOOTP]** must be set to "0" (Disabled).	Default: 0 Default: 0 Default: 0 Default: 0 Minimum: 0 Maximum: 255 Type: Read/Write Reset Required: Yes

Parameter No.	Name and Description	Details
08 09 10 11	**[Subnet Cfg 1]** **[Subnet Cfg 2]** **[Subnet Cfg 3]** **[Subnet Cfg 4]** Sets the bytes of the subnet mask.  **Important:** To set the subnet mask using these parameters, **Parameter 03 - [BOOTP]** must be set to "0" (Disabled).	Default: 0 Default: 0 Default: 0 Default: 0 Minimum: 0 Maximum: 255 Type: Read/Write Reset Required: Yes
12 13 14 15	**[Gateway Cfg 1]** **[Gateway Cfg 2]** **[Gateway Cfg 3]** **[Gateway Cfg 4]** Sets the bytes of the gateway address.  **Important:** To set the gateway address using these parameters, **Parameter 03 - [BOOTP]** must be set to "0" (Disabled).	Default: 0 Default: 0 Default: 0 Default: 0 Minimum: 0 Maximum: 255 Type: Read/Write Reset Required: Yes
16	**[EN Rate Cfg]** Sets the network data rate at which the adapter communicates. (Updates **Parameter 17 - [EN Rate Act]** after a reset.)	Default: 0 = Autodetect Values: 0 = Autodetect 1 = 10 Mbps Full 2 = 10 Mbps Half 3 = 100 Mbps Full 4 = 100 Mbps Half Type: Read/Write Reset Required: Yes
17	**[EN Rate Act]** Displays the network data rate actually used by the adapter.	Default: 0 = No Link Values: 0 = No Link 1 = 10 Mbps Full 2 = 10 Mbps Half 3 = 100 Mbps Full 4 = 100 Mbps Half Type: Read Only
18	**[Ref/Fdbk Size]** Displays the size of the Reference/Feedback. The drive determines the size of the Reference/Feedback.	Default: 0 = 16-bit Values: 0 = 16-bit 1 = 32-bit Type: Read Only
19	**[Datalink Size]** Displays the size of each Datalink word. The drive determines the size of Datalinks.	Default: 0 = 16-bit Values: 0 = 16-bit 1 = 32-bit Type: Read Only

Parameter No.	Name and Description	Details
20	**[Reset Module]** No action if set to "0" (Ready). Resets the adapter if set to "1" (Reset Module). Restores the adapter to its factory default settings if set to "2" (Set Defaults). This parameter is a command. It will be reset to "0" (Ready) after the command has been performed.	Default: 0 = Ready Values: 0 = Ready 1 = Reset Module 2 = Set Defaults Type: Read/Write Reset Required: No
	ATTENTION: Risk of injury or equipment damage exists. If the adapter is transmitting I/O that controls the drive, the drive may fault when you reset the adapter. Determine how your drive will respond before resetting a connected adapter.	
21	**[Comm Flt Action]** Sets the action that the adapter and drive will take if the adapter detects that I/O messaging communications have been disrupted. This setting is effective only if I/O that controls the drive is transmitted through the adapter. When communication is re-established, the drive will automatically receive commands over the network again.	Default: 0 = Fault Values: 0 = Fault 1 = Stop 2 = Zero Data 3 = Hold Last 4 = Send Flt Cfg Type: Read/Write Reset Required: No
	ATTENTION: Risk of injury or equipment damage exists. **Parameter 21 - [Comm Flt Action]** lets you determine the action of the adapter and connected drive if I/O communications are disrupted. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable).	
22	**[Idle Flt Action]** Sets the action that the adapter and drive will take if the adapter detects that the controller is in program mode or faulted. This setting is effective only if I/O that controls the drive is transmitted through the adapter. When the controller is put back in Run mode, the drive will automatically receive commands over the network again.	Default: 0 = Fault Values: 0 = Fault 1 = Stop 2 = Zero Data 3 = Hold Last 4 = Send Flt Cfg Type: Read/Write Reset Required: No
	ATTENTION: Risk of injury or equipment damage exists. **Parameter 22 - [Idle Flt Action]** lets you determine the action of the adapter and connected drive when the controller is idle. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a faulted controller).	
23	**[DPI I/O Cfg]** Sets the I/O that is transferred through the adapter.	Default: xxx0 0001 Bit Values: 0 = I/O disabled 1 = I/O enabled Type: Read/Write Reset Required: Yes

Bit Definition	Not Used	Not Used	Not Used	Datalink D	Datalink C	Datalink B	Datalink A	Cmd/Ref
Default	x	x	x	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0

Parameter No.	Name and Description	Details
24	**[DPI I/O Act]** Displays the I/O that the adapter is actively transmitting. The value of this parameter will usually be equal to the value of **Parameter 23 - [DPI I/O Cfg]**.	Default: xxx0 0001 Bit Values: 0 = I/O disabled 1 = I/O enabled Type: Read Only Bit Definition: Not Used, Not Used, Not Used, Datalink D, Datalink C, Datalink B, Datalink A, Cmd/Ref Default: x, x, x, 0, 0, 0, 0, 1 Bit: 7, 6, 5, 4, 3, 2, 1, 0
25	**[Flt Cfg Logic]** Sets the Logic Command data that is sent to the drive if any of the following is true: • **Parameter 21 - [Comm Flt Action]** is set to “4” (Send Flt Cfg) and I/O communications are disrupted. • **Parameter 22 - [Idle Flt Action]** is set to “4” (Send Flt Cfg) and the controller is idle. • **Parameter 41 - [Peer Flt Action]** is set to “4” (Send Flt Cfg) and Peer I/O communications are disrupted. The bit definitions will depend on the product to which the adapter is connected. See Appendix D or the documentation for the drive being used.	Default: 0000 0000 0000 0000 Minimum: 0000 0000 0000 0000 Maximum: 1111 1111 1111 1111 Type: Read/Write Reset Required: No
26	**[Flt Cfg Ref]** Sets the Reference data that is sent to the drive if any of the following is true: • **Parameter 21 - [Comm Flt Action]** is set to “4” (Send Flt Cfg) and I/O communications are disrupted. • **Parameter 22 - [Idle Flt Action]** is set to “4” (Send Flt Cfg) and the controller is idle. • **Parameter 41- [Peer Flt Action]** is set to “4” (Send Flt Cfg) and Peer I/O communications are disrupted.	Default: 0 Minimum: 0 Maximum: 4294967295 Type: Read/Write Reset Required: No **Important:** If the drive uses a 16-bit Reference, the most significant word of this value must be set to zero (0) or a fault will occur.
27 28 29 30 31 32 33 34	**[Flt Cfg A1 In]** **[Flt Cfg A2 In]** **[Flt Cfg B1 In]** **[Flt Cfg B2 In]** **[Flt Cfg C1 In]** **[Flt Cfg C2 In]** **[Flt Cfg D1 In]** **[Flt Cfg D2 In]** Sets the data that is sent to the Datalink in the drive if any of the following is true: • **Parameter 21 - [Comm Flt Action]** is set to “4” (Send Flt Cfg) and I/O communications are disrupted. • **Parameter 22 - [Idle Flt Action]** is set to “4” (Send Flt Cfg) and the controller is idle. • **Parameter 41 - [Peer Flt Action]** is set to “4” (Send Flt Cfg) and Peer I/O communications are disrupted.	Default: 0 Default: 0 Default: 0 Default: 0 Default: 0 Default: 0 Default: 0 Default: 0 Minimum: 0 Maximum: 4294967295 Type: Read/Write Reset Required: No **Important:** If the drive uses 16-bit Datalinks, the most significant word of this value must be set to zero (0) or a fault will occur.

Parameter No.	Name and Description	Details
35	**[M-S Input]** Sets the Master-Slave input data. This data is produced by the scanner and consumed by the adapter.	Default: xxx0 0001 Bit Values: 0 = I/O disabled 1 = I/O enabled Type: Read/Write Reset Required: Yes

Bit Definition	Not Used	Not Used	Not Used	Datalink D Input	Datalink C Input	Datalink B Input	Datalink A Input	Cmd/Ref
Default	x	x	x	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0

36	**[M-S Output]** Sets the Master-Slave output data. This data is produced by the adapter and consumed by the Master device (for example, scanner).	Default: xxx0 0001 Bit Values: 0 = I/O disabled 1 = I/O enabled Type: Read/Write Reset Required: Yes

Bit Definition	Not Used	Not Used	Not Used	Datalink D Output	Datalink C Output	Datalink B Output	Datalink A Output	Cmd/Ref
Default	x	x	x	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0

37	**[Ref Adjust]** Sets the percent scale factor for the Reference received from the network.	Default: 100.00% Minimum: 0.00% Maximum: 200.00% Type: Read/Write Reset Required: No

ATTENTION: To guard against equipment damage and/or personal injury, note that changes to **Parameter 37 - [Ref Adjust]** take effect immediately. A drive receiving its Reference from the adapter will receive the newly scaled Reference, resulting in a change of speed.

38 39	**[Peer A Input]** **[Peer B Input]** Sets the destination of the Peer I/O input. The adapter receives this data from the network and sends it to the drive. **Important:** Changes to these parameters are ignored when **Parameter 47 - [Peer Inp Enable]** is "1" (On). **Important:** If the parameter is set to input a Logic Command, configure the mask in **Parameter 40 - [Peer Cmd Mask]** so that the desired bits from the Peer device are used.	Default: 0 = Off Default: 0 = Off Values: 0 = Off 1 = Cmd/Ref 2 = Datalink A Input 3 = Datalink B Input 4 = Datalink C Input 5 = Datalink D Input Type: Read/Write Reset Required: No
40	**[Peer Cmd Mask]** Sets the mask for the Logic Command word when it is received through peer input. If the mask bit is "0" (Off), the command bit is ignored and not used. If the mask bit is "1" (On), the command bit is checked and used. **Important:** If the adapter receives a Logic Command from both a Master device and a Peer device, each command bit must have only one source. The source of command bits set to "0" will be the Master device. The source of command bits set to "1" will be the Peer device.	Default: 0000 0000 0000 0000 Minimum: 0000 0000 0000 0000 Maximum: 1111 1111 1111 1111 Values: 0 = Ignore bit 1 = Check bit Type: Read/Write Reset Required: Yes

Parameter No.	Name and Description	Details
41	**[Peer Flt Action]** Sets the action that the adapter and drive will take if the adapter detects that Peer I/O communications have been disrupted. This setting is effective only if I/O is transmitted through the adapter.	Default: 0 = Fault Values: 0 = Fault 1 = Stop 2 = Zero Data 3 = Hold Last 4 = Send Flt Cfg Type: Read/Write Reset Required: No
	ATTENTION: Risk of injury or equipment damage exists. **Parameter 41 - [Peer Flt Action]** lets you determine the action of the adapter and connected drive if the adapter is unable to communicate with the designated peer. By default, this parameter faults the drive. You can set this parameter so that the drive continues to run. Precautions should be taken to ensure that the setting of this parameter does not create a risk of injury or equipment damage. When commissioning the drive, verify that your system responds correctly to various situations (for example, a disconnected cable).	
42 43 44 45	**[Peer Inp Addr 1]** **[Peer Inp Addr 2]** **[Peer Inp Addr 3]** **[Peer Inp Addr 4]** Sets the bytes in the IP address that specifies the device from which the adapter receives (consumes) Peer I/O data.  **Important:** The Peer Inp Addr must be on the same subnet as the 20-COMM-E. Refer to IP Addresses on page G-5 for more information. Changes to these parameters are ignored when **Parameter 47 - [Peer Inp Enable]** is “1” (On).	Default: 0 Default: 0 Default: 0 Default: 0 Minimum: 0 Maximum: 255 Type: Read/Write Reset Required: No
46	**[Peer Inp Timeout]** Sets the time-out for a Peer I/O connection. If the time is reached without the adapter receiving (consuming) a message, the adapter will respond with the action specified in **Parameter 41 - [Peer Flt Action]**. In an adapter receiving (consuming) Peer I/O, the value of this parameter must be greater than the product of the value of **Parameter 52 - [Peer Out Time]** in the adapter transmitting (producing) Peer I/O multiplied by the value of **Parameter 53 - [Peer Out Skip]** in the adapter transmitting (producing) Peer I/O.	Default: 10.00 Seconds Minimum: 0.01 Seconds Maximum: 10.00 Seconds Type: Read/Write Reset Required: No
47	**[Peer Inp Enable]** Determines if Peer I/O input is on or off.	Default: 0 = Off Values: 0 = Off 1 = On Type: Read/Write Reset Required: No
48	**[Peer Inp Status]** Displays the status of the consumed Peer I/O input connection.	Default: 0 = Off Values: 0 = Off 1 = Waiting 2 = Running 3 = Faulted Type: Read Only

Parameter No.	Name and Description	Details
49 50	**[Peer A Output]** **[Peer B Output]** Selects the source of the Peer I/O output data. The adapter transmits this data to the network. **Important:** Changes to these parameters are ignored when **Parameter 51 - [Peer Out Enable]** is “1” (On).	Default: 0 = Off Default: 0 = Off Values: 0 = Off 1 = Cmd/Ref 2 = Datalink A Input 3 = Datalink B Input 4 = Datalink C Input 5 = Datalink D Input 6 = Datalink A Output 7 = Datalink B Output 8 = Datalink C Output 9 = Datalink D Output Type: Read/Write Reset Required: No
51	**[Peer Out Enable]** Determines if Peer I/O output is on or off.	Default: 0 = Off Values: 0 = Off 1 = On Type: Read/Write Reset Required: No
52	**[Peer Out Time]** Sets the minimum time that an adapter will wait when transmitting data to a peer. **Important:** Changes to these parameters are ignored when **Parameter 51 - [Peer Out Enable]** is “1” (On).	Default: 10.00 Seconds Minimum: 0.01 Seconds Maximum: 10.00 Seconds Type: Read/Write Reset Required: No
53	**[Peer Out Skip]** Sets the maximum time that an adapter will wait when transmitting data to a peer. The value of **Parameter 52 - [Peer Out Time]** is multiplied by the value of this parameter to set the time. **Important:** Changes to these parameters are ignored when **Parameter 51 - [Peer Out Enable]** is “1” (On).	Default: 1 Minimum: 1 Maximum: 16 Type: Read/Write Reset Required: No
54	**[Access Control]** This parameter is only available for Series A (version 2.003 or earlier) adapters. Sets the access to the Web interface and Web-configurable e-mail notification feature.	Default: xxxx xx01 Bit Values: 0 = Disabled 1 = Enabled Type: Read/Write Reset Required: No
55	**[Web Enable]** This parameter is only available for Series B (version 3.xxx or later) adapters. Displays the setting of the adapter Web Pages Switch (SW2) when the adapter was last reset.	Default: 0 = Disabled Values: 0 = Disabled 1 = Enabled Type: Read Only

Bit Definition	Not Used	Not Used	Not Used	Not Used	...	Not Used	Not Used	Not Used	Not Used	Not Used	Not Used	E-mail Config	Web Enable
Default	x	x	x	x	...	x	x	x	x	x	x	0	1
Bit	31	30	29	28	...	7	6	5	4	3	2	1	0

Parameter No.	Name and Description	Details
56	**[Web Features]** This parameter is only available for Series B (version 3.xxx or later) adapters. Sets the access to the Web interface and Web-configurable e-mail notification feature.	Default: xxxx xxx1 Bit Values: 0 = Disabled 1 = Enabled Type: Read/Write Reset Required: No

Bit Definition	Not Used	Not Used	Not Used	Not Used	Not Used	Not Used	Not Used	E-mail Cfg
Default	x	x	x	x	x	x	x	1
Bit	7	6	5	4	3	2	1	0

EtherNet/IP Objects

Appendix C presents information about the EtherNet/IP objects that can be accessed using Explicit Messages. For information on the format of Explicit Messages and example ladder logic programs, refer to Chapter 6, Using Explicit Messaging.

Object	Class Code		Page
	Hex.	Dec.	
Identity Object	0x01	1	C-2
Assembly Object	0x04	4	C-3

Ethernet Link Object	0xF6	246	C-37

(1) These objects are NOT supported when the adapter is used with a PowerFlex 750-Series drive.

(2) This object is supported only when the adapter is used with a PowerFlex 750-Series drive.

TIP: Refer to the EtherNet/IP specification for more information about EtherNet/IP objects. Information about the EtherNet/IP specification is available on the ODVA web site (http://www.odva.org).

Supported Data Types

Data Type	Description
BOOL	8-bit value -- low bit is true or false
BOOL[n]	Array of n bits
BYTE	8-bit unsigned integer
CONTAINER	32-bit parameter value - sign extended if necessary
DINT	32-bit signed integer
DWORD	32-bit unsigned integer
INT	16-bit signed integer
LWORD	64-bit unsigned integer
REAL	32-bit floating point
SHORT_STRING	1-byte length indicator + that many characters
SINT	8-bit signed integer
STRING[n]	Array of n characters
STRUCT	Structure name only - no size in addition to elements
TCHAR	8 or 16-bit character
UDINT	32-bit unsigned integer
UINT	16-bit unsigned integer
USINT	8-bit unsigned integer
WORD	16-bit unsigned integer

Identity Object

Class Code

Hexadecimal	Decimal
0x01	1

Services

	Implemented for:		
Service Code	Class	Instance	Service Name
0x05	No	Yes	Reset
0x0E	Yes	Yes	Get_Attribute_Single
0x01	Yes	Yes	Get_Attributes_All

Instances

The number of instances depends on the number of components in the device connected to the adapter. This number of components can be read in Instance 0, Attribute 2.

Instance	Description
0	Class
1	Host
2…15	Peripherals on Ports 1…14

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
2	Get	Max Instance	WORD	Total number of instances

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Vendor ID	WORD	1 = Allen-Bradley
2	Get	Device Type	WORD	123
3	Get	Product Code	WORD	Number identifying product name and rating
4	Get	Revision: Major Minor	STRUCT of: BYTE BYTE	 Value varies Value varies
5	Get	Status	WORD	Bit 0 = Owned Bit 8 = Minor recoverable fault Bit 10 = Major recoverable fault
6	Get	Serial Number	DWORD	Unique 32-bit number
7	Get	Product Name	SHORT_STRING	Product name and rating

Assembly Object

Class Code

Hexadecimal	Decimal
0x04	4

Services

	Implemented for:		
Service Code	Class	Instance	Service Name
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

Instance	Description
1	All I/O data being read from the DPI device (read-only)
2	All I/O data written to the DPI device (read/write)

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Revision	WORD	2
2	Get	Max Instance	WORD	2
100	Set	Control Timeout	WORD	Control timeout in seconds

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Number of Members	WORD	1
2	Get	Member List	ARRAY of STRUCT: WORD WORD Packed EPATH	 Size of member data Size of member path Member path
3	Conditional [1]	Data	Array of Bits	Data to be transferred
4	Get	Size	WORD	Size of assembly data in bits

[1] For instance 1, access rule for the data attribute is Get. For instance 2, it is Get/Set.

Important: Setting an assembly object attribute can be done only when the Control Timeout (class attribute 100) has been set to a non-zero value.

Register Object

Class Code

Hexadecimal	Decimal
0x07	7

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

Instance	Description
1	All I/O data being read from the DPI device (read-only)
2	All I/O data written to the DPI device (read/write)
3	Logic Status and Feedback data (read-only)
4	Logic Command and Reference data (read/write)
5	Datalink A (input data from device to scanner) (read only)
6	Datalink A (output data from scanner to device) (read/write)
7	Datalink B (input data from device to scanner) (read only)
8	Datalink B (output data from scanner to device) (read/write)
9	Datalink C (input data from device to scanner) (read only)
10	Datalink C (output data from scanner to device) (read/write)
11	Datalink D (input data from device to scanner) (read only)
12	Datalink D (output data from scanner to device) (read/write)
13	Logic Status and Feedback Data (read-only)
14	Mask (1) (read/write)
15	Logic Status (read-only)
16	Logic Command (read/write)
17	Feedback (read-only)
18	Reference (read/write)

(1) The mask command word is set to the value of the first word of the data where there are ones in the second word of the data. Command = (word 1 and not word 2) or (word 1 and word 2). This only controls specified bits in the Logic Command data to the DPI product and does not change the Reference value.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
100	Set	Control Timeout	WORD	Control timeout in seconds

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Bad Flag	BOOL	If set to 1, then attribute 4 may contain invalid data. 0 = good 1 = bad
2	Get	Direction	BOOL	Direction of data transfer 0 = Producer Register (drive to network) 1 = Consumer Register (network to drive)
3	Get	Size	WORD	Size of register data in bits
4	Conditional (1)	Data	ARRAY of BITS	Data to be transferred

(1) For this attribute, the Access Rule is Get if Direction = 0. The Access Rule is Set if Direction = 1.

Important: Setting a Register object attribute can be done only when the Control Timeout (class attribute 100) has been set to a non-zero value.

Parameter Object

Class Code

Hexadecimal	Decimal
0x0F	15

Important: This object is not supported when the adapter is used with a PowerFlex 750-Series drive.

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x01	Yes	Yes	Get_Attributes_All
0x05	Yes	No	Reset
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single
0x4B	No	Yes	Get_Enum_String

Instances

The number of instances depends on the number of parameters in the DPI drive. The adapter parameters are appended to the list of drive parameters. The total number of parameters can be read in Instance 0, Attribute 2.

Instance	Description
0	Class Attributes
1	Drive Parameter 1 Attributes
⋮	⋮
n	Last Drive Parameter n Attributes (1)
n + 1	Adapter Parameter 1 Attributes
⋮	⋮
n + m	Last Adapter Parameter m Attributes (2)

(1) n represents the number of parameters in the drive.

(2) m represents the number of parameters in the adapter.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Revision	WORD	1
2	Get	Max Instance	WORD	Number of parameters
8	Get	Parameter Class Descriptor	WORD	0 = False, 1 = True Bit 0 = Supports parameter instances Bit 1 = Supports full attributes Bit 2 = Must do NVS save command Bit 3 = Parameters are stored in NVS
9	Get	Configuration Assembly Instance	WORD	0
10	Set	Native Language	BYTE	0 = English 1 = French 2 = Spanish 3 = Italian 4 = German 5 = Japanese 6 = Portuguese 7 = Mandarin Chinese 8 = Russian 9 = Dutch

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	(1)	Parameter Value	(2)	(3)
2	Get	Link Path Size	BYTE	0 = No link specified n = The size of Attribute 3 in bytes
3	Get	Link Path		(4)
4	Get	Descriptor	WORD	0 = False, 1 = True Bit 1 = Supports ENUMs Bit 2 = Supports scaling Bit 3 = Supports scaling links Bit 4 = Read only Bit 5 = Monitor Bit 6 = Extended precision scaling
5	Get	Data Type	BYTE	1 = WORD (16-bit) 2 = UINT (16-bit) 3 = INT (16-bit) 5 = SINT 6 = DINT 8 = USINT 9 = UDINT 11 = REAL 22 = SHORT_STRING 24 = BYTE 25 = DWORD
6	Get	Data Size	BYTE	(3)
7	Get	Parameter Name String	SHORT_STRING	(3)
8	Get	Units String	SHORT_STRING	(3)
9	Get	Help String	SHORT_STRING	Null string
10	Get	Minimum Value	(2)	(3)
11	Get	Maximum Value	(2)	(3)
12	Get	Default Value	(2)	(3)
13	Get	Scaling Multiplier	WORD	(3)
14	Get	Scaling Divisor	WORD	(3)
15	Get	Scaling Base	WORD	(3)
16	Get	Scaling Offset	WORD	(3)
17	Get	Multiplier Link	WORD	(3)
18	Get	Divisor Link	WORD	(3)
19	Get	Base Link	WORD	(3)
20	Get	Offset Link	WORD	(3)
21	Get	Decimal Precision	BYTE	(3)

(1) Access rule is defined in Bit 4 of instance attribute 4 (0 = Get/Set, 1 = Get).

(2) Specified in descriptor, data type, and data size.

(3) Value varies based on parameter instance.

(4) Refer to the EtherNet/IP specification for a description of the link path.

Parameter Group Object

Class Code

Hexadecimal	Decimal
0x10	16

Important: This object is not supported when the adapter is used with a PowerFlex 750-Series drive.

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	No	Set_Attribute_Single

Instances

The number of instances depends on the number of groups in the device. A group of adapter parameters is appended to the list of groups in the device. The total number of groups can be read in Instance 0, Attribute 2.

Number	Description
0	Class Attributes
1	Drive Group 1 Attributes
⋮	⋮
n	Last Drive Group Attributes
n + 1	Adapter Group Attributes

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Parameter group version	WORD	1
2	Get	Max Instance	WORD	Total number of groups
8	Set	Native Language	BYTE	0 = English 1 = French 2 = Spanish 3 = Italian 4 = German 5 = Japanese 6 = Portuguese 7 = Mandarin Chinese 8 = Russian 9 = Dutch

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Group Name String	SHORT_STRING	Group name
2	Get	Number of Members in Group	WORD	Number of parameters in group
3	Get	1st Parameter Number in Group	WORD	(1)
4	Get	2nd Parameter Number in Group	WORD	(1)
n	Get	⋮	WORD	(1)

(1) Value varies based on group instance.

PCCC Object

Class Code

Hexadecimal	Decimal
0x67	103

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x4B	No	Yes	Execute_PCCC
0x4C	No	Yes	Execute_DH+

Instances

Supports Instance 1.

Class Attributes

Not supported.

Instance Attributes

Not supported.

Message Structure for Execute_PCCC

Request		
Name	**Data Type**	**Description**
Length	USINT	Length of requestor ID
Vendor	UINT	Vendor number of requestor
Serial Number	UDINT	ASA serial number of requestor
Other	Product Specific	Identifier of user, task, etc. on the requestor
CMD	USINT	Command byte
STS	USINT	0
TNSW	UINT	Transport word
FNC	USINT	Function code; not used for all CMDs.
PCCC_ params	ARRAY of USINT	CMD/FNC specific parameters

Response		
Name	**Data Type**	**Description**
Length	USINT	Length of requestor ID
Vendor	UINT	Vendor number of requestor
Serial Number	UDINT	ASA serial number of requestor
Other	Product Specific	Identifier of user, task, etc. on the requestor
CMD	USINT	Command byte
STS	USINT	Status byte
TNSW	UINT	Transport word. Same value as the request.
EXT_STS	USINT	Extended status; not used for all CMDs.
PCCC_ results	ARRAY of USINT	CMD/FNC specific result data

Message Structure for Execute_DH+

Request		
Name	**Data Type**	**Description**
DLink	UINT	Destination Link ID
DSta	USINT	Destination Station number
DUser	USINT	Destination “User” number
SLink	UINT	Source Link ID
SSta	USINT	Source Station number
SUser	USINT	Source User number
CMD	USINT	Command byte
STS	USINT	0
TNSW	UINT	Transport word
FNC	USINT	Function code; not used for all CMDs
PCCC_ params	ARRAY of USINT	CMD/FNC specific parameters

Response		
Name	**Data Type**	**Description**
DLink	UINT	Destination Link ID
DSta	USINT	Destination Station number
DUser	USINT	Destination “User” number
SLink	UINT	Source Link ID
SSta	USINT	Source Station number
SUser	USINT	Source User number
CMD	USINT	Command byte
STS	USINT	Status byte
TNSW	UINT	Transport word. Same value as the request.
EXT_STS	USINT	Extended status; not used for all CMDs
PCCC_ results	ARRAY of USINT	CMD/FNC specific result data

The adapter supports the following PCCC command types:

CMD	FNC	Description
0x06	0x03	Identify host and some status
0x0F	0x67	PLC-5 typed write
0x0F	0x68	PLC-5 typed read
0x0F	0x95	Encapsulate other protocol
0x0F	0xA2	SLC 500 protected typed read with 3 address fields
0x0F	0xAA	SLC 500 protected typed write with 3 address fields
0x0F	0xA1	SLC 500 protected typed read with 2 address fields
0x0F	0xA9	SLC 500 protected typed write with 2 address fields
0x0F	0x00	Word range read
0x0F	0x01	Word range write

For more information regarding PCCC commands, see *DF1 Protocol and Command Set Manual* (Allen-Bradley publication 1770-6.5.16).

N-Files

<table>
<tr><th>N-File</th><th colspan="4">Description</th></tr>
<tr><td>N40</td><td colspan="4">This N-file lets you use Emulated Block Transfer messages to read and write many types of DPI messages. To use Emulated Block Transfer messages, you send a Write message to N40:0…N40:63, wait until the adapter responds with a reply message, and then read the response data in N40:0…N40:63 with a Read message.

For details about Block Transfer messages and the data required for each byte in the N-File, refer to the Remote I/O Adapter User Manual (publication 20COMM-UM004).

Bits 15…8 are the Most Significant Byte. Bits 7…0 are the Least Significant Byte.</td></tr>

Important: If your controller or HMI platform supports CIP messaging, use the CIP Parameter object to get and set parameters.

N-File	Description
N150…N199	These N-files let you read and write parameter values in DPI Port 0 (the host PowerFlex drive) as 32-bit double words. You can interpret the data in various ways (for example, 32-bit real, 32-bit integer) To read a parameter, you need to send a message with two elements. For example, to read parameter 1, read two elements beginning at N150:2. As another example, to read parameters 2…6, read ten elements beginning at N150:4.
N150:0…1	Number of parameters in the drive
N150:2…249	Drive parameters 1…124
N151:0…249	Drive parameters 125…249
N152:0…249	Drive parameters 250…374
N153:0…249	Drive parameters 375…499
⋮	⋮
N199:0…249	Drive parameters 6125…6249

N-File	Description
N201…N212	These N-files let you read and write values to DPI and Host parameters in Ports 1…14 (for example, a HIM or adapter) as 32-bit double words. You can interpret the data in various ways (for example, 32-bit real, 32-bit integer) To read a parameter, you need to send a message with two elements. For example, to read parameter 1 in the peripheral connected to DPI port 1, read two elements beginning at N201:2. As another example, to read parameters 2…6 in the peripheral connected to DPI port 5 (the adapter), read ten elements beginning at N209:4.
N201:0…1	Number of parameters in the DPI peripheral at DPI port 1
N201:2…249	Parameters 1…124 in the DPI peripheral at DPI port 1
N202:0…249	Parameters 125…249 in the DPI peripheral at DPI port 1
N203:0…1	Number of parameters in the DPI peripheral at DPI port 2
N203:2…249	Parameters 1…124 in the DPI peripheral at DPI port 2
N204:0…249	Parameters 125…249 in the DPI peripheral at DPI port 2
N205:0…1	Number of parameters in the DPI peripheral at DPI port 3
N205:2…249	Parameters 1…124 in the DPI peripheral at DPI port 3
N206:0…249	Parameters 125…249 in the DPI peripheral at DPI port 3
N207:0…1	Number of parameters in the DPI peripheral at DPI port 4
N207:2…249	Parameters 1…124 in the DPI peripheral at DPI port 4
N208:0…249	Parameters 125…249 in the DPI peripheral at DPI port 4
N209:0…1	Number of parameters in the DPI peripheral at DPI port 5
N209:2…249	Parameters 1…124 in the DPI peripheral at DPI port 5
N210:0…249	Parameters 125…249 in the DPI peripheral at DPI port 5

1	Drive Component 1
2	Drive Component 2
⋮	⋮
16384	Class Attributes (Adapter)
16385	Adapter Component 1
⋮	⋮

(1) These instances are supported only when the adapter is used with a PowerFlex 750-Series drive.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Family Code	BYTE	0x00 = DPI Peripheral 0x30 = PowerFlex 70 0x34 = PowerFlex 700H 0x38, 0x39, or 0x3A= PowerFlex 700 0x40 = PowerFlex 7000 0x48, 0x49, or 0x4A = PowerFlex 700S 0x5A = SMC Flex 0x68, 0x69, or 0x6A = PowerFlex 700VC 0x90 = PowerFlex 753/755 0xA0 = 20-750-xxx Option Module 0xFF = HIM
1	Get	Family Text	STRING[16]	Text identifying the device.

Attribute ID	Access Rule	Name	Data Type	Description
2	Set	Language Code	BYTE	0 = English 1 = French 2 = Spanish 3 = Italian 4 = German 5 = Japanese 6 = Portuguese 7 = Mandarin Chinese 8 = Russian 9 = Dutch
3	Get	Product Series	BYTE	1 = A 2 = B …
4	Get	Number of Components	BYTE	Number of components (e.g., main control board, I/O boards) in the device.
5	Set	User Definable Text	STRING[16]	Text identifying the device with a user-supplied name.
6	Get	Status Text	STRING[12]	Text describing the status of the device.
7	Get	Configuration Code	BYTE	Identification of variations.
8	Get	Configuration Text	STRING[16]	Text identifying a variation of a family device.
9	Get	Brand Code	WORD	0x0001 = Allen-Bradley
11	Get	NVS Checksum	WORD	Checksum of the Non-Volatile Storage in a device.
12	Get	Class Revision	WORD	2 = DPI
13	Get	Character Set Code	BYTE	0 = SCANport HIM 1 = ISO 8859-1 (Latin 1) 2 = ISO 8859-2 (Latin 2) 3 = ISO 8859-3 (Latin 3) 4 = ISO 8859-4 (Latin 4) 5 = ISO 8859-5 (Cyrillic) 6 = ISO 8859-6 (Arabic) 7 = ISO 8859-7 (Greek) 8 = ISO 8859-8 (Hebrew) 9 = ISO 8859-9 (Turkish) 10 = ISO 8859-10 (Nordic) 255 = ISO 10646 (Unicode)
14	Get	Product Option Support	BOOL[64]	
15	Get	Languages Supported	STRUCT of: BYTE BYTE[n]	 Number of Languages Language Codes (see Class Attribute 2)
16	Get	Date of Manufacture	STRUCT of: WORD BYTE BYTE	 Year Month Day
17	Get	Product Revision	STRUCT of: BYTE BYTE	 Major Firmware Release Minor Firmware Release
18	Get	Serial Number	DWORD	Value between 0x00000000 and 0xFFFFFFFF
19	Set	Language Selected	BYTE	0 = Default (HIM will prompt at start up) 1 = Language was selected (no prompt)
20	Set	Customer-Generated Firmware	STRING[36]	GUID (Globally Unique Identifier) identifying customer firmware flashed into the device.
30	Get	International Status Text	STRINGN	Text describing the status of device with support for Unicode.
31	Get/Set	International User Definable Text	STRINGN	Text identifying the device with a user-supplied name with support for Unicode.

Attribute ID	Access Rule	Name	Data Type	Description
34	Get	Key Information	STRUCT of: DWORD DWORD WORD WORD WORD BYTE BYTE BYTE BYTE BYTE BYTE[16]	 Rating Code Device Serial Number Customization Code Customization Revision Brand Code Family Code Config Code Language Code Major Revision Minor Revision Customer-Generated Firmware UUID
35	Get	NVS CRC	DWORD	A 32-bit CRC of the Non-Volatile Storage in a device.
39	Get	SI Driver Code	WORD	Code identifying the protocol between the device and host.
128	Get	Customization Code	WORD	Code identifying the customized device.
129	Get	Customization Revision Number	WORD	Revision of the customized device.
130	Get	Customization Device Text	STRING[32]	Text identifying the customized device.

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
3	Get	Component Name	STRING[32]	Name of the component
4	Get	Component Firmware Revision	STRUCT of: BYTE BYTE	 Major Revision Minor Revision
8	Get	Component Serial Number	DWORD	Value between 0x00000000 and 0xFFFFFFFF
9	Get	International Component Name	STRINGN	Name of the component with support for Unicode.

DPI Parameter Object

Class Code

Hexadecimal	Decimal
0x93	147

To access "Host Config" parameters, use the HOST DPI Parameter Object (Class code 0x9F).

Instances

The number of instances depends on the number of parameters in the device. The total number of parameters can be read in Instance 0, Attribute 0.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Host
0x4000…0x43FF	16384…17407	Adapter
0x4400…0x47FF	17408…18431	DPI Port 1
0x4800…0x4BFF	18432…19455	DPI Port 2
0x4C00…0x4FFF	19456…20479	DPI Port 3
0x5000…0x53FF	20480…21503	DPI Port 4
0x5400…0x57FF	21504…22527	DPI Port 5
0x5800…0x5BFF	22528…23551	DPI Port 6
0x5C00…0x5FFF (1)	23552…24575	DPI Port 7

0x6400…0x67FF (1)	25600…26623	DPI Port 9
0x6800…0x6BFF (1)	26624…27647	DPI Port 10
0x6C00…0x6FFF (1)	27648…28671	DPI Port 11
0x7000…0x73FF (1)	28672…29695	DPI Port 12
0x7400…0x77FF (1)	29696…30719	DPI Port 13
0x7800…0x7BFF (1)	30720…31743	DPI Port 14

Example	Description
0	Class Attributes (Drive)
1	Drive Parameter 1 Attributes
2	Drive Parameter 2 Attributes
⋮	⋮
16384	Class Attributes (Adapter)
16385	Adapter Parameter 1 Attributes
⋮	⋮

(1) These instances are supported only when the adapter is used with a PowerFlex 750-Series drive.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Number of Instances	WORD	Number of parameters in the device
1	Set	Write Protect Password	WORD	0 = Password disabled n = Password
2	Set	NVS Command Write	BYTE	0 = No Operation 1 = Store values in active memory to NVS 2 = Load values in NVS to active memory 3 = Load default values to active memory
3	Get	NVS Parameter Value Checksum	WORD	Checksum of all parameter values in a user set in NVS
4	Get	NVS Link Value Checksum	WORD	Checksum of parameter links in a user set in NVS
5	Get	First Accessible Parameter	WORD	First parameter available if parameters are protected by passwords. A "0" indicates all parameters are protected.
7	Get	Class Revision	WORD	2 = DPI
8	Get	First Parameter Processing Error	WORD	The first parameter that has been written with a value outside of its range. A "0" indicates no errors.
9	Set	Link Command	BYTE	0 = No Operation 1 = Clear All Parameter Links (This does not clear links to function blocks.)

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
6	Get	DPI Offline Read Full	STRUCT of: BOOL[32] CONTAINER CONTAINER CONTAINER STRING[16] STRING[4] WORD WORD WORD WORD WORD WORD BYTE BYTE WORD WORD CONTAINER WORD WORD WORD INT	 Descriptor Offline minimum value Offline maximum value Offline default value Parameter name Offline parameter units Online minimum parameter instance Online maximum parameter instance Online default parameter instance Multiple parameter instance Divisor parameter instance Base parameter instance Offset parameter instance Formula number Pad byte (always zero) Help instance Pad word (always a value of zero) Parameter value Multiplier Divisor Base Offset
7	Get	DPI Online Read Full	STRUCT of: BOOL[32] CONTAINER(1) CONTAINER CONTAINER CONTAINER WORD WORD STRING[4] WORD WORD WORD INT BYTE[3] BYTE STRING[16]	 Descriptor (see page C-19) Parameter value Minimum value Maximum value Default value Next parameter Previous parameter Units (for example, Amp, Hz) Multiplier (2) Divisor (2) Base (2) Offset (2) Link (source of the value) (0 = no link) Always zero (0) Parameter name
8	Get	DPI Descriptor	BOOL[32]	Descriptor (see page C-19)
9	Get/Set	DPI Parameter Value	Various	Parameter value in NVS. (3)
10	Get/Set	DPI RAM Parameter Value	Various	Parameter value in temporary memory. Valid only for DPI drives.
11	Get/Set	DPI Link	BYTE[3]	Link (parameter or function block that is the source of the value) (0 = no link)
12	Get	Help Object Instance	WORD	ID for help text for this parameter
13	Get	DPI Read Basic	STRUCT of: BOOL[32] CONTAINER CONTAINER CONTAINER CONTAINER STRING[16] STRING[4]	 Descriptor (see page C-19) Parameter value Minimum value Maximum value Default value Parameter name Units (for example, Amp, Hz)
14	Get	DPI Parameter Name	STRING[16]	Parameter name
15	Get	DPI Parameter Alias	STRING[16]	Customer supplied parameter name.
16	Get	Parameter Processing Error	BYTE	0 = No error 1 = Value is less than the minimum 2 = Value is greater than the maximum

Attribute ID	Access Rule	Name	Data Type	Description
18	Get	International DPI Offline Parameter Text	STRUCT of: STRINGN STRINGN	 International parameter name International offline units

22	Get	International DPI Offline Read Full	STRUCT of: BOOL CONTAINER CONTAINER CONTAINER WORD WORD WORD WORD WORD WORD BYTE BYTE WORD WORD CONTAINER WORD WORD WORD INT BOOL[32] STRINGN STRINGN	 Descriptor Offline minimum value Offline maximum value Offline default value Online minimum parameter instance Online maximum parameter instance Online default parameter instance Multiple parameter instance Divisor parameter instance Base parameter instance Offset parameter instance Formula number Pad byte (always zero) Help instance Pad word (always a value of zero) Parameter value Multiplier Divisor Base Offset Extended DPI descriptor International DPI parameter name International DPI offline parameter units

(1) A CONTAINER is a 32-bit block of data that contains the data type used by a parameter value. If signed, the value is sign extended. Padding is used in the CONTAINER to ensure that it is always 32-bits.

(2) This value is used in the formulas used to convert the parameter value between display units and internal units. Refer to Formulas for Converting on page C-21.

(3) Do NOT continually write parameter data to NVS. Refer to the attention on page 6-1.

Descriptor Attributes

Bit	Name	Description
0	Data Type (Bit 1)	Right bit is least significant bit (0). 000 = BYTE used as an array of Boolean 001 = WORD used as an array of Boolean 010 = BYTE (8-bit integer) 011 = WORD (16-bit integer) 100 = DWORD (32-bit integer) 101 = TCHAR (8-bit (not unicode) or 16-bits (unicode) 110 = REAL (32-bit floating point value) 111 = Use bits 16, 17, 18
1	Data Type (Bit 2)	
2	Data Type (Bit 3)	
3	Sign Type	0 = Unsigned 1 = Signed
4	Hidden	0 = Visible 1 = Hidden
5	Not a Link Sink	0 = Parameter can sink a link 1 = Parameter cannot sink a link
6	Not Recallable	0 = Recallable from NVS 1 = Not Recallable from NVS
7	ENUM	0 = No ENUM text 1 = ENUM text
8	Writable	0 = Read only 1 = Read/write
9	Not Writable When Enabled	0 = Writable when enabled (for example, drive running) 1 = Not writable when enabled
10	Instance	0 = Parameter value is not a Reference to another parameter 1 = Parameter value refers to another parameter
11	Uses Bit ENUM Mask	This parameter instance supports the Bit ENUM Mask attribute. For more information, see the definition of the attribute.
12	Decimal Place (Bit 0)	Number of digits to the right of the decimal point. 0000 = 0 1111 = 15
13	Decimal Place (Bit 1)	
14	Decimal Place (Bit 2)	
15	Decimal Place (Bit 3)	
16	Extended Data Type (Bit 4)	Right bit is least significant bit (16). 000 = Reserved 001 = DWORD used as an array of Boolean 010 = Reserved 011 = Reserved 100 = Reserved 101 = Reserved 110 = Reserved 111 = Reserved
17	Extended Data Type (Bit 5)	
18	Extended Data Type (Bit 6)	
19	Parameter Exists	Used to mark parameters that are not available to network tools.
20	Not Used	Reserved
21	Formula Links	Indicates the Formula Data is derived from other parameters.
22	Access Level (Bit 1)	A 3-bit field used to control access to parameter data.
23	Access Level (Bit 2)	
24	Access Level (Bit 3)	
25	Writable ENUM	ENUM text: 0 = Read Only, 1 = Read/Write
26	Not a Link Source	0 = May be the source end of a link 1 = May not be the source end of a link
27	Enhanced Bit ENUM	Parameter supports enhanced bit ENUMs.
28	Enhanced ENUM	Parameter supports enhanced ENUMs.
29	Uses DPI Limits Object	Parameter uses the DPI LImits Object.
30	Extended Descriptor	Parameter uses Extended Descriptor bits, which can be obtained by reading the DPI Extended Descriptor attribute for this parameter.
31	Always Upload/Download	Parameter shall always be included in uploads and downloads.

Extended Descriptor Attributes

Bit	Name	Description
0	Indirect Mode	0 = Analog (selects entire parameters) 1 = Digital (selects individual bits within parameters)
1	Indirect Type 0	Analog input list (Instance 0xFFFF)
2	Indirect Type 1	Digital input list (Instance 0xFFFE)
3	Indirect Type 2	Feedback list (Instance 0xFFFD)
4	Indirect Type 3	Analog output list (Instance 0xFFFC)
5	Indirect Type 4	Digital output list (Instance 0xFFFB)
6	Indirect Type 5	Undefined (Instance 0xFFFA)
7	Indirect Type 6	Undefined (Instance 0xFFF9)
8	Indirect Type 7	Undefined (Instance 0xFFF8)
9	Indirect Type 8	Undefined (Instance 0xFFF7)
10	Indirect Type 9	Undefined (Instance 0xFFF6)
11	Indirect Type 10	Undefined (Instance 0xFFF5)
12	Indirect Type 11	Undefined (Instance 0xFFF4)
13	Indirect Type 12	Undefined (Instance 0xFFF3)
14	Indirect Type 13	Undefined (Instance 0xFFF2)
15	Indirect Type 14	Parameter-specific list
16	FP Max Decimals Bit 0	These four bits are used on REAL parameters only. They indicate the maximum number of decimal places to be displayed for small values. A value of 0 indicates to not limit the number of decimal places used.
17	FP Max Decimals Bit 1	
18	FP Max Decimals Bit 2	
19	FP Max Decimals Bit 1	
20	Extended Parameter Reference	0 = Not an Extended Parameter Reference 1 = Extended Parameter Reference An Extended Parameter Reference contains a reference to another parameter. The value is formatted the same as an analog mode Indirect Selector parameter (SSpppp, where SS = slot number of device to which this Extended Parameter Reference is pointing, and pppp = number of the parameter or diagnostic item to which this Extended Parameter Reference is pointing). Note that an Extended Parameter Reference can only select parameters unlike an Indirect Selector. An Extended Parameter Reference could be used to configure a Datalink or show the source of a Reference (among other uses).
21	Uses Rating Table Object	This parameter has rating-dependent defaults and limits that can be obtained from the Rating Table Object. The Offline Read Full will include the default value for the smallest rating and limits that will accommodate the full range of values allowed in the family of devices using this particular combination of Family Code and Config Code. The Online Read Full will include the rating-dependent default and limit values for this particular combination of Family Code, Config Code, and Rating Code.
22	Writable Referenced Parameter	This bit must be zero unless the parameter is an Extended Parameter Reference. If the parameter is an Extended Parameter Reference, then: 0 = The referenced parameter may be read-only or writable. 1 = The referenced parameter must always be writable (including while running).
23	Disallow Zero	This bit must be zero unless the parameter is an Indirect Selector or Extended Parameter Reference. If the parameter is an Indirect Selector or Extended Parameter Reference, then: 0 = Allow zero 1 = Disallow zero If this bit is cleared (indicating that a value of zero is allowed), the device must support the “Zero Text” parameter attribute so that a software tool or HIM can obtain text from the Zero Text parameter attribute. If this bit is set (indicating that a value of zero is disallowed), a software tool or HIM will not allow the user to enter a value of zero.
24	Datalink Out	This bit is used by offline tools and indicates that this is a Datalink Out parameter. Bit 20 must also be set.
25	Datalink In	This bit is used by offline tools and indicates that this is a Datalink In parameter. Bits 20 and 22 must also be set.
26	Not Writable While IO Active	This parameter cannot be written if the I/O data being exchanged between the Host and the peripheral is valid.

Bit	Name	Description
27	Command Parameter	This parameter commands the drive to take an action, such as “Reset Defaults” or “Autotune,” and then returns to a value of zero. Offline software tools will not allow setting this parameter to anything other than a value of zero. If an offline file contains a Command Parameter with a non-zero value, the offline software tool will change the value to zero. Note that command parameters cannot have values that do not return to zero.
28	Current Value Is Default	This bit identifies a parameter that will not change if a “Reset Defaults” is commanded. For example, if a drive contains a Language parameter that is set to German, setting defaults will leave the parameter set to German. Likewise, if the parameter is set to French, setting defaults will leave the parameter set to French.
29	Use Zero Text	If the “Disallow Zero” bit is set, this bit must be cleared. If the “Disallow Zero” bit is cleared, then: 0 = Use Disabled Text parameter class attribute. 1 = Use Zero Text parameter instance attribute.
30-31	Reserved	Reserved

Formulas for Converting

Display Value = ((Internal Value + Offset) x Multiplier x Base) / (Divisor x $10^{\text{Decimal Places}}$)

Internal Value = ((Display Value x Divisor x $10^{\text{Decimal Places}}$) / (Multiplier x Base)) - Offset

Common Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Object Specific Services

Service Code	Implemented for:		Service Name	Allocation Size (in bytes)	
	Class	Instance		Par. Number	Par. Value
0x4B	Yes	No	Get_Attributes_Scattered	2	2
0x4C	Yes	No	Set_Attributes_Scattered	2	2
0x4D (1)	Yes	No	Get_Attributes_Scattered	4	4
0x4E (1)	Yes	No	Set_Attributes_Scattered	4	4

(1) These services are supported only when the adapter is used with a PowerFlex 750-Series drive.

The table below lists the parameters for the Get_Attributes_Scattered and Set_Attributes_Scattered object-specific service:

Name	Data Type	Description
Parameter Number	DWORD	Parameter to read or write
Parameter Value	DWORD	Parameter value to read or write (zero when reading)

DPI Fault Object

Class Code

Hexadecimal	Decimal
0x97	151

Products such as PowerFlex drives use this object for faults. Adapters use this object for events.

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

The number of instances depends on the maximum number of faults or events supported in the queue. The maximum number of faults/events can be read in Instance 0, Attribute 2.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Host
0x4000…0x43FF	16384…17407	Adapter
0x4400…0x47FF	17408…18431	DPI Port 1
0x4800…0x4BFF	18432…19455	DPI Port 2
0x4C00…0x4FFF	19456…20479	DPI Port 3
0x5000…0x53FF	20480…21503	DPI Port 4
0x5400…0x57FF	21504…22527	DPI Port 5
0x5800…0x5BFF	22528…23551	DPI Port 6
0x5C00…0x5FFF (1)	23552…24575	DPI Port 7
0x6000…0x63FF (1)	24576…25599	DPI Port 8
0x6400…0x67FF (1)	25600…26623	DPI Port 9
0x6800…0x6BFF (1)	26624…27647	DPI Port 10
0x6C00…0x6FFF (1)	27648…28671	DPI Port 11
0x7000…0x73FF (1)	28672…29695	DPI Port 12
0x7400…0x77FF (1)	29696…30719	DPI Port 13
0x7800…0x7BFF (1)	30720…31743	DPI Port 14

Example	Description
0	Class Attributes (Drive)
1	Most Recent Drive Fault
2	Second Most Recent Drive Fault
⋮	⋮
16384	Class Attributes (Adapter)
16385	Most Recent Adapter Event
⋮	⋮

(1) These instances are supported only when the adapter is used with a PowerFlex 750-Series drive.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Class Revision	WORD	Revision of object
2	Get	Number of Instances	WORD	Maximum number of faults/events that the device can record in its queue
3	Set	Fault Command Write	BYTE	0 = No Operation 1 = Clear Fault/Event 2 = Clear Fault/Event Queue 3 = Reset Device
4	Get	Fault Trip Instance Read	WORD	Fault that tripped the device. For adapters, this value is always 1 when faulted.

Attribute ID	Access Rule	Name	Data Type	Description
5	Get	Fault Data List	STRUCT of: BYTE BYTE WORD[n]	Number of faults/events in the queue. A “0” indicates the fault queue is empty.
6	Get	Number of Recorded Faults	WORD	Number of faults/events in the queue. A “0” indicates the fault queue is empty.
7	Get	Fault Parameter Reference	WORD	Number of faults/events in the queue. A “0” indicates the fault queue is empty.

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Full/All Information	STRUCT of WORD STRUCT of: BYTE BYTE STRING[16] STRUCT of: LWORD BOOL[16] WORD CONTAINER[n]	Fault code Fault source DPI port DPI Device Object Fault text Fault time stamp Timer value (0 = timer not supported) BOOL[0]: (0 = invalid data, 1 = valid data) BOOL[1]: (0 = elapsed time, 1 = real time) BOOL[2…15]: Not used Reserved Reserved
1	Get	Basic Information	STRUCT of WORD STRUCT of: BYTE BYTE STRUCT of: LWORD BOOL[16]	Fault code Fault source DPI port DPI Device Object Fault time stamp Timer value (0 = timer not supported) BOOL[0]: (0 = invalid data, 1 = valid data) BOOL[1]: (0 = elapsed time, 1 = real time) BOOL[2…15]: Not used
2	Get	International Fault Text	STRINGN	Text describing the fault with support for Unicode.

DPI Alarm Object

Class Code

Hexadecimal	Decimal
0x98	152

Products such as PowerFlex drives use this object for alarms or warnings. Adapters do not support this object.

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

The number of instances depends on the maximum number of alarms supported by the queue. The maximum number of alarms can be read in Instance 0, Attribute 2.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Host
Only host devices can have alarms.		

Example	Description
0	Class Attributes (Drive)
1	Most Recent Alarm
2	Second Most Recent Alarm
⋮	⋮

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Class Revision	WORD	Revision of object
2	Get	Number of Instances	WORD	Maximum number of alarms that the device can record in its queue
3	Set	Alarm Command Write	BYTE	0 = No Operation 1 = Clear Alarm 2 = Clear Alarm Queue 3 = Reset Device
4	Get	Fault Data List	STRUCT of: BYTE BYTE WORD[n]	Reserved
5	Get	Number of Recorded Alarms	WORD	Number of alarms in the queue. A “0” indicates the alarm queue is empty.

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Full/All Information	STRUCT of WORD STRUCT of: BYTE BYTE STRING[16] STRUCT of: LWORD BOOL[16] WORD CONTAINER[n]	Alarm code Alarm source DPI port DPI Device Object Alarm text Alarm time stamp Timer value (0 = timer not supported) BOOL[0]: (0 = invalid data, 1 = valid data) BOOL[1]: (0 = elapsed time, 1 = real time) BOOL[2…15] Reserved Reserved Reserved
1	Get	Basic Information	STRUCT of WORD STRUCT of: BYTE BYTE STRUCT of: LWORD BOOL[16]	Alarm code Alarm source DPI port DPI Device Object Alarm time stamp Timer value (0 = timer not supported) BOOL[0]: (0 = invalid data, 1 = valid data) BOOL[1]: (0 = elapsed time, 1 = real time) BOOL[2…15] Reserved
2	Get	International Alarm Text	STRINGN	Text describing the alarm with support for Unicode.

DPI Diagnostic Object

Class Code

Hexadecimal	Decimal
0x99	153

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

The number of instances depends on the maximum number of diagnostic items in the device. The total number of diagnostic items can be read in Instance 0, Attribute 2.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Host
0x4000…0x43FF	16384…17407	Adapter
0x4400…0x47FF	17408…18431	DPI Port 1
0x4800…0x4BFF	18432…19455	DPI Port 2

0x6800…0x6BFF (1)	26624…27647	DPI Port 10
0x6C00…0x6FFF (1)	27648…28671	DPI Port 11
0x7000…0x73FF (1)	28672…29695	DPI Port 12
0x7400…0x77FF (1)	29696…30719	DPI Port 13
0x7800…0x7BFF (1)	30720…31743	DPI Port 14

Example	Description
0	Class Attributes (Drive)
1	Drive Diagnostic Item 1
2	Drive Diagnostic Item 2
⋮	⋮
16384	Class Attributes (Adapter)
16385	Adapter Diagnostic Item1
⋮	⋮

(1) These instances are supported only when the adapter is used with a PowerFlex 750-Series drive.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Class Revision	WORD	1
2	Get	Number of Instances	WORD	Number of diagnostic items in the device.
3	Get	ENUM Offset	WORD	DPI ENUM object instance offset

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Full/All Information	STRUCT of:	
			BOOL[32]	Descriptor (see page C-19)
			CONTAINER (1)	Value
			CONTAINER	Minimum value
			CONTAINER	Maximum value
			CONTAINER	Default value
			WORD	Pad Word
			WORD	Pad Word
			STRING[4]	Units (for example, Amp, Hz)
			WORD	Multiplier (2)
			WORD	Divisor (2)
			WORD	Base (2)
			INT	Offset (2)
			DWORD	Link (source of the value) (0 = no link)
			STRING[16]	Diagnostic name text
1	Get/Set	Value	Various	Diagnostic item value
2	Get	International Diagnostic Item Text	STRUCT of:	
			STRINGN	Diagnostic name text
			STRINGN	Diagnostic units text
3	Get	International Full Read All	STRUCT of:	
			BOOL[32]	Descriptor
			CONTAINER	Value
			CONTAINER	Minimum
			CONTAINER	Maximum
			CONTAINER	Default
			WORD	Pad Word
			WORD	Pad Word
			WORD	Multiplier
			WORD	Divisor
			WORD	Base
			INT	Offset
			DWORD	Pad
			BOOL[32]	Extended descriptor
			STRINGN	Diagnostic name text
			STRINGN	Diagnostic units text

(1) A CONTAINER is a 32-bit block of data that contains the data type used by a value. If signed, the value is sign extended. Padding is used in the CONTAINER to ensure that it is always 32-bits.

(2) This value is used in the formulas used to convert the value between display units and internal units. Refer to Formulas for Converting on page C-21.

DPI Time Object

Class Code

Hexadecimal	Decimal
0x9B	155

Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Instances

The number of instances depends on the number of timers in the device. Instance 1 is always reserved for a real-time clock although a device may not support it. The total number of timers can be read in Instance 0, Attribute 2.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Host
0x4000…0x43FF	16384…17407	Adapter
0x4400…0x47FF	17408…18431	DPI Port 1
0x4800…0x4BFF	18432…19455	DPI Port 2
0x4C00…0x4FFF	19456…20479	DPI Port 3
0x5000…0x53FF	20480…21503	DPI Port 4
0x5400…0x57FF	21504…22527	DPI Port 5
0x5800…0x5BFF	22528…23551	DPI Port 6
0x5C00…0x5FFF (1)	23552…24575	DPI Port 7
0x6000…0x63FF (1)	24576…25599	DPI Port 8
0x6400…0x67FF (1)	25600…26623	DPI Port 9
0x6800…0x6BFF (1)	26624…27647	DPI Port 10
0x6C00…0x6FFF (1)	27648…28671	DPI Port 11
0x7000…0x73FF (1)	28672…29695	DPI Port 12
0x7400…0x77FF (1)	29696…30719	DPI Port 13
0x7800…0x7BFF (1)	30720…31743	DPI Port 14

Example	Description
0	Class Attributes (Drive)
1	Real Time Clock (Predefined) (not always supported)
2	Timer 1
3	Timer 2
⋮	⋮

(1) These instances are supported only when the adapter is used with a PowerFlex 750-Series drive.

Class Attributes

Attribute ID	Access Rule	Name	Data Type	Description
1	Get	Class Revision	WORD	Revision of object
2	Get	Number of Instances	WORD	Number of timers in the object, excluding the real-time clock that is predefined.
3	Get	First Device Specific Timer	WORD	Instance of the first timer that is not predefined.
4	Set	Time Command Write	BYTE	0 = No Operation 1 = Clear all timers (Does not clear the real-time clock or read only timers)
5	Get	Number of Supported Time Zones	WORD	Number of time zones described in the Time Zone List attribute.
6	Get	Time Zone List	STRUCT	Identifies a time zone.
7	Get/Set	Active Time Zone ID	WORD	The ID field of the Time Zone List structure for the desired time zone.

Attribute ID	Access Rule	Name	Data Type	Description
8	Get	Active Time Zone Data	STRUCT of: INT BYTE BYTE BYTE BYTE BYTE BYTE INT BYTE BYTE BYTE BYTE BYTE BYTE	 Standard bias Standard month Standard day of week Standard week Standard hour Standard minute Standard second Daylight offset Daylight month Daylight day of week Daylight week Daylight hour Daylight minute Daylight second
9	Get/Set	Custom Time Zone Data	STRUCT of: INT BYTE BYTE BYTE BYTE BYTE BYTE INT BYTE BYTE BYTE BYTE BYTE BYTE	 Standard bias Standard month Standard day of week Standard week Standard hour Standard minute Standard second Daylight offset Daylight month Daylight day of week Daylight week Daylight hour Daylight minute Daylight second

Instance Attributes

Attribute ID	Access Rule	Name	Data Type	Description
0	Get	Read Full	STRUCT of: STRING[16] LWORD or STRUCT BOOL[16]	 Name of the timer Elapsed time in milliseconds unless timer is a real-time clock (see attribute 2) See attribute 3
1	Get	Timer Text	STRING[16]	Name of the timer
2	Get/Set	Timer Value	LWORD -or- STRUCT of: WORD BYTE BYTE BYTE BYTE BYTE BYTE	Elapsed time in milliseconds unless the timer is a real-time clock. Real-Time Clock Data: Milliseconds (0…999) Seconds (0…59) Minutes (0…59) Hours (0…23) Days (1…31) Months (1 = January, 12 = December) Years (since 1972)
3	Get	Timer Descriptor	BOOL[16]	BOOL[0]: (0 = invalid data, 1 = valid data) BOOL[1]: (0 = elapsed time, 1 = real time) BOOL[2…15]: Not used
4	Get	International Read Full	STRUCT of: STRINGN STRUCT BOOL[16]	 International timer text Timer value Timer descriptor
5	Get	International Timer Text	STRINGN	Name of this timer
6	Get	Clock Status	BOOL[32]	Identifies clock status
8	Get/Set	Number of Leap Seconds	INT	Identifies the current number of Leap Seconds.
9	Get	Clock Options	BOOL[32]	Identifies the optional functionality available in the device's System Clock.
10	Get/Set	Clock Options Enable	BOOL[32]	Identifies which of the clock's options are enabled.

Host DPI Parameter Object

Class Code

Hexadecimal	Decimal
0x9F	159

To access Device parameters, use the DPI Parameter Object (Class Code 0x93).

Important: The Host DPI Parameter Object is supported only when the adapter is used with a PowerFlex 750-Series drive.

Instances

The number of instances depends on the number of parameters in the device. The total number of parameters can be read in Instance 0, Attribute 0.

Instances (Hex.)	(Dec.)	Device
0x0000…0x3FFF	0…16383	Reserved
0x4000…0x43FF	16384…17407	Adapter
0x4400…0x47FF	17408…18431	DPI Port 1
0x4800…0x4BFF	18432…19455	DPI Port 2
0x4C00…0x4FFF	19456…20479	DPI Port 3
0x5000…0x53FF	20480…21503	DPI Port 4
0x5400…0x57FF	21504…22527	DPI Port 5
0x5800…0x5BFF	22528…23551	DPI Port 6
0x5C00…0x5FFF	23552…24575	DPI Port 7
0x6000…0x63FF	24576…25599	DPI Port 8
0x6400…0x67FF	25600…26623	DPI Port 9
0x6800…0x6BFF	26624…27647	DPI Port 10
0x6C00…0x6FFF	27648…28671	DPI Port 11
0x7000…0x73FF	28672…29695	DPI Port 12
0x7400…0x77FF	29696…30719	DPI Port 13
0x7800…0x7BFF	30720…31743	DPI Port 14

Example	Description
16384	Class Attributes (Adapter)
16385	Adapter Parameter 1 Attributes
16386	Adapter Parameter 2 Attributes
⋮	⋮
17408	Class Attributes (HIM)

(1) A CONTAINER is a 32-bit block of data that contains the data type used by a parameter value. If signed, the value is sign extended. Padding is used in the CONTAINER to ensure that it is always 32-bits.

(2) This value is used in the formulas used to convert the parameter value between display units and internal units. Refer to Formulas for Converting on page C-35.

(3) Do NOT continually write parameter data to NVS. Refer to the attention on page 6-1.

Descriptor Attributes

Bit	Name	Description
0	Data Type (Bit 1)	Right bit is least significant bit (0). 000 = USINT used as an array of Boolean 001 = UINT used as an array of Boolean 010 = USINT (8-bit integer) 011 = UINT (16-bit integer) 100 = UDINT (32-bit integer) 101 = TCHAR ((8-bit (not Unicode) or 16-bits (Unicode)) 110 = REAL (32-bit floating point value) 111 = Use bits 16, 17, 18
1	Data Type (Bit 2)	
2	Data Type (Bit 3)	
3	Sign Type	0 = unsigned 1 = signed
4	Hidden	0 = visible 1 = hidden
5	Not a Link Sink	0 = May be the sink end of a link 1 = May not be the sink end of a link
6	Not Recallable	0 = Recallable from NVS 1 = Not Recallable from NVS
7	ENUM	0 = No ENUM text 1 = ENUM text
8	Writable	0 = Read only 1 = Read/write
9	Not Writable When Enabled	0 = Writable when enabled (e.g., drive running) 1 = Not writable when enabled
10	Instance	0 = Parameter value is not a Reference to another parameter 1 = Parameter value refers to another parameter
11	Uses Bit ENUM Mask	This parameter instance supports the Bit ENUM Mask attribute. For more information, see the definition of the attribute.
12	Decimal Place (Bit 0)	Number of digits to the right of the decimal point. 0000 = 0 1111 = 15
13	Decimal Place (Bit 1)	
14	Decimal Place (Bit 2)	
15	Decimal Place (Bit 3)	
16	Extended Data Type (Bit 4)	Bit 16 is the least significant bit. 000 = Reserved 001 = UDINT used as an array of Boolean 010 = Reserved 011 = Reserved 100 = Reserved 101 = Reserved 110 = Reserved 111 = Reserved
17	Extended Data Type (Bit 5)	
18	Extended Data Type (Bit 6)	
19	Parameter Exists	Used to mark parameters that are not available to network tools.
20	Not Used	Reserved
21	Formula Links	Indicates the Formula Data is derived from other parameters.
22	Access Level (Bit 1)	A 3-bit field used to control access to parameter data.
23	Access Level (Bit 2)	
24	Access Level (Bit 3)	
25	Writable ENUM	ENUM text: 0 = Read Only, 1 = Read/Write
26	Not a Link Source	0 = May be the source end of a link 1 = May not be the source end of a link
27	Enhanced Bit ENUM	Parameter supports enhanced bit ENUMs.
28	Enhanced ENUM	Parameter supports enhanced ENUMs.
29	Uses DPI Limits Object	Parameter uses the DPI Limits Object. Intelligent offline tools make use of the Limits Object to select limits and units.
30	Extended Descriptor	Parameter uses Extended Descriptor bits, which can be obtained by reading the DPI Extended Descriptor attribute for this parameter.
31	Always Upload/Download	Parameter shall always be included in uploads and downloads.

Extended Descriptor Attributes

Bit	Name	Description
0	Indirect Mode	0 = Analog (selects entire parameters) 1 = Digital (selects individual bits within parameters)
1	Indirect Type 0	Analog input list (Instance 0xFFFF)
2	Indirect Type 1	Digital input list (Instance 0xFFFE)
3	Indirect Type 2	Feedback list (Instance 0xFFFD)
4	Indirect Type 3	Analog output list (Instance 0xFFFC)
5	Indirect Type 4	Digital output list (Instance 0xFFFB)
6	Indirect Type 5	Undefined (Instance 0xFFFA)
7	Indirect Type 6	Undefined (Instance 0xFFF9)
8	Indirect Type 7	Undefined (Instance 0xFFF8)
9	Indirect Type 8	Undefined (Instance 0xFFF7)
10	Indirect Type 9	Undefined (Instance 0xFFF6)
11	Indirect Type 10	Undefined (Instance 0xFFF5)
12	Indirect Type 11	Undefined (Instance 0xFFF4)
13	Indirect Type 12	Undefined (Instance 0xFFF3)
14	Indirect Type 13	Undefined (Instance 0xFFF2)
15	Indirect Type 14	Parameter-specific list
16	FP Max Decimals Bit 0	These four bits are used on REAL parameters only. They indicate the maximum number of decimal places to be displayed for small values. A value of 0 indicates to not limit the number of decimal places used.
17	FP Max Decimals Bit 1	
18	FP Max Decimals Bit 2	
19	FP Max Decimals Bit 1	
20	Extended Parameter Reference	0 = Not an Extended Parameter Reference 1 = Extended Parameter Reference An Extended Parameter Reference contains a reference to another parameter. The value is formatted the same as an analog mode Indirect Selector parameter (SSpppp, where SS = slot number of device to which this Extended Parameter Reference is pointing, and pppp = number of the parameter or diagnostic item to which this Extended Parameter Reference is pointing). Note that an Extended Parameter Reference can only select parameters unlike an Indirect Selector. An Extended Parameter Reference could be used to configure a Datalink or show the source of a Reference (among other uses).
21	Uses Rating Table Object	This parameter has rating-dependent defaults and limits that can be obtained from the Rating Table Object. The Offline Read Full will include the default value for the smallest rating and limits that will accommodate the full range of values allowed in the family of devices using this particular combination of Family Code and Config Code. The Online Read Full will include the rating-dependent default and limit values for this particular combination of Family Code, Config Code, and Rating Code.
22	Writable Referenced Parameter	This bit must be zero unless the parameter is an Extended Parameter Reference. If the parameter is an Extended Parameter Reference, then: 0 = The referenced parameter may be read-only or writable. 1 = The referenced parameter must always be writable (including while running).
23	Disallow Zero	This bit must be zero unless the parameter is an Indirect Selector or Extended Parameter Reference. If the parameter is an Indirect Selector or Extended Parameter Reference, then: 0 = Allow zero 1 = Disallow zero If this bit is cleared (indicating that a value of zero is allowed), the device must support the “Zero Text” parameter attribute so that a software tool or HIM can obtain text from the Zero Text parameter attribute. If this bit is set (indicating that a value of zero is disallowed), a software tool or HIM will not allow the user to enter a value of zero.
24	Datalink Out	This bit is used by offline tools and indicates that this is a Datalink Out parameter. Bit 20 must also be set.
25	Datalink In	This bit is used by offline tools and indicates that this is a Datalink In parameter. Bits 20 and 22 must also be set.
26	Not Writable While IO Active	This parameter cannot be written if the I/O data being exchanged between the Host and the peripheral is valid.

Bit	Name	Description
27	Command Parameter	This parameter commands the drive to take an action, such as “Reset Defaults” or “Autotune,” and then returns to a value of zero. Offline software tools will not allow setting this parameter to anything other than a value of zero. If an offline file contains a Command Parameter with a non-zero value, the offline software tool will change the value to zero. Note that command parameters cannot have values that do not return to zero.
28	Current Value Is Default	This bit identifies a parameter that will not change if a “Reset Defaults” is commanded. For example, if a drive contains a Language parameter that is set to German, setting defaults will leave the parameter set to German. Likewise, if the parameter is set to French, setting defaults will leave the parameter set to French.
29	Use Zero Text	If the “Disallow Zero” bit is set, this bit must be cleared. If the “Disallow Zero” bit is cleared, then: 0 = Use Disabled Text parameter class attribute. 1 = Use Zero Text parameter instance attribute.
30-31	Reserved	Reserved

Formulas for Converting

Display Value = ((Internal Value + Offset) x Multiplier x Base) / (Divisor x $10^{\text{Decimal Places}}$))

Internal Value = ((Display Value x Divisor x $10^{\text{Decimal Places}}$) / (Multiplier x Base)) - Offset

Common Services

Service Code	Implemented for:		Service Name
	Class	Instance	
0x0E	Yes	Yes	Get_Attribute_Single
0x10	Yes	Yes	Set_Attribute_Single

Object Specific Services

Service Code	Implemented for:		Service Name	Allocation Size (in bytes)	
	Class	Instance		Par. Number	Par. Value
0x4D	Yes	No	Get_Attributes_Scattered	4	4
0x4E	Yes	No	Set_Attributes_Scattered	4	4

The table below lists the parameters for the Get_Attributes_Scattered and Set_Attributes_Scattered object-specific service:

Name	Data Type	Description
Parameter Number	UDINT	Parameter to read or write
Parameter Value	UDINT	Parameter value to read or write (zero when reading)

TCP/IP Interface Object

Class Code

Hexadecimal	Decimal
0xF5	245

Attribute ID	Access Rule	Name	Data Type	Description
5	Get	Media Counters	STRUCT of:	RX = Received, TX = Transmitted
			DWORD	RX frames not having integral number of octets long
			DWORD	RX frames not passing FCS check
			DWORD	TX frames having one collision
			DWORD	TX frames having multiple collisions
			DWORD	Number of times of SQE test error message
			DWORD	TX Frames delayed first attempt by busy medium
			DWORD	Collisions detected later than 512 bit-times in trans.
			DWORD	TX frames failing due to excessive collisions
			DWORD	TX frames failing due to intern MAC sublayer TX error
			DWORD	Times of carrier sense condition loss during trans.
			DWORD	RX frames exceeding the maximum frame size
			DWORD	RX frames failing due to intern MAC sublayer RX error

Logic Command/Status Words

Appendix D presents the definitions of the Logic Command and Logic Status words that are used for some products that can be connected to the adapter. If the Logic Command/Logic Status for the product that you are using is not listed, refer to your product's documentation.

PowerFlex 70/70EC, PowerFlex 700/700VC, and PowerFlex 700H Drives

Logic Command Word

Logic Bits																	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Command	Description

				x	x											Decel Rate	00 = No Command 01 = Decel Rate 1 Command (Par. 142) 10 = Decel Rate 2 Command (Par. 143) 11 = Hold Decel Rate
	x	x	x													Reference Select [3]	000 = No Command 001 = Ref A Select (Par. 90) 010 = Ref B Select (Par. 93) 011 = Preset 3 (Par. 103) 100 = Preset 4 (Par. 104) 101 = Preset 5 (Par. 105) 110 = Preset 6 (Par. 106) 111 = Preset 7 (Par. 107)
x																MOP Decrement	0 = Not Decrement 1 = Decrement

[1] A "0 = Not Stop" condition (logic 0) must first be present before a "1 = Start" condition will start the drive. The Start command acts as a momentary Start command. A "1" will start the drive, but returning to "0" will not stop the drive.

[2] This Start will not function if a digital input (parameters 361-366) is programmed for 2-Wire Control (option 7, 8 or 9).

[3] This Reference Select will not function if a digital input (parameters 361-366) is programmed for "Speed Sel 1, 2 or 3" (option 15, 16 or 17). Note that Reference Select is "Exclusive Ownership" – see drive User Manual for more information.

(1) See Parameter 304 - [Limit Status] in the PowerFlex 700S drive User Manual for a description of the limit status conditions.

PowerFlex 750-Series Drives

Important: When using a 20-COMM-E adapter with a PowerFlex 750-Series drive, the upper word (bits 16…31) of the Logic Command and Logic Status words are not accessible and cannot be used. Only when using a PowerFlex 750-Series drive with a 20-750 communication Option Module (or the PowerFlex 755 drive's embedded EtherNet/IP adapter) is the upper word accessible and used.

Logic Command Word

x																Reserved	

A

Adapter

Devices such as drives, controllers, and computers usually require an adapter to provide a communication interface between them and a network such as EtherNet/IP. An adapter reads data on the network and transmits it to the connected device. It also reads data in the device and transmits it to the network.

The 20-COMM-E EtherNet/IP adapter connects PowerFlex 7-Class drives to an EtherNet/IP network. Adapters are sometimes also called “cards,” “embedded communication options,” “gateways,” “modules,” and “peripherals.”

B

BOOTP (Bootstrap Protocol)

BOOTP lets the adapter configure itself dynamically at boot time if the network has a BOOTP server. The BOOTP server assigns the adapter a preconfigured IP address, a subnet mask, and a gateway address; therefore, you do not have to configure these using the parameters in the adapter. BOOTP can make it easier to administer an Ethernet network. A free version of Rockwell Software’s BOOTP Server can be accessed at http://www.software.rockwell.com/support/download/detail.cfm?ID=3390.

Bridge

A network device that can route messages from one network to another. A bridge also refers to a communications module in a ControlLogix controller that connects the controller to a network. See also Scanner.

C

CAN (Controller Area Network)

CAN is a serial bus protocol on which DPI is based.

CIP (Common Industrial Protocol)

CIP is the transport and application layer protocol used for messaging over EtherNet/IP, ControlNet, and DeviceNet networks. The protocol is used for implicit messaging (real-time I/O) and explicit messaging (configuration, data collection, and diagnostics).

ControlFLASH

An Allen-Bradley software tool that lets users electronically update firmware on printed circuit boards.

Controller

A controller, also called programmable logic controller, is a solid-state control system that has a user-programmable memory for storage of instructions to implement specific functions such as I/O control, logic, timing, counting, report generation, communication, arithmetic, and data file manipulation. A controller consists of a central processor, input/output interface, and memory. See also Scanner.

D

Data Rate

The speed at which data is transferred on the EtherNet/IP network. You can set the adapter to a data rate of 10 Mbps Full-Duplex, 10 Mbps Half-Duplex, 100 Mbps Full-Duplex, or 100 Mbps Half-Duplex. If another device on the network sets or auto-negotiates the data rate, you can set the adapter to automatically detect the data rate.

Datalinks

A Datalink is a type of pointer used by PowerFlex 7-Class drives to transfer data to and from the controller. Datalinks allow specified parameters to be read or written to without using explicit messages. When enabled, each Datalink consumes either four bytes or eight bytes in both the input and output image table of the controller. The drive determines the size of Datalinks.

DPI (Drive Peripheral Interface)

A second generation peripheral communication interface used by various Allen-Bradley drives and power products, such as PowerFlex 7-Class drives. It is a functional enhancement to SCANport.

DPI Peripheral

A device that provides an interface between DPI and a network or user. Peripheral devices are also referred to as “adapters” or “modules.” The 20-COMM-E adapter, 1203-USB or 1203-SSS converter, and PowerFlex 7-Class HIMs (20-HIM-xxx) are examples of DPI peripherals.

DPI Product

A device that uses the DPI communications interface to communicate with one or more peripheral devices. For example, a motor drive such as a PowerFlex 7-Class drive is a DPI product. In this manual, a DPI product is also referred to as “drive” or “host.”

DriveExplorer Software

A tool for monitoring and configuring Allen-Bradley products and adapters. It can be run on computers running various Microsoft Windows operating systems. DriveExplorer (version 3.xx or higher) can be used to configure this adapter and PowerFlex drives. Information about DriveExplorer software and a free lite version can be accessed at http://www.ab.com/drives/driveexplorer.

DriveTools SP Software

A software suite designed for running on various Microsoft Windows operating systems. This software suite provides a family of tools, including DriveExecutive, that you can use to program, monitor, control, troubleshoot, and maintain Allen-Bradley products. DriveTools SP can be used with PowerFlex drives. Information about DriveTools SP can be accessed at http://www.ab.com/drives/drivetools.

Duplex

Duplex describes the mode of communication. *Full-duplex* communications let a device exchange data in both directions at the same time. *Half-duplex* communications let a device exchange data only in one direction at a time. The duplex used by the adapter depends on the type of duplex that other network devices, such as switches, support.

E

EDS (Electronic Data Sheet) Files

Simple text files that are used by network configuration tools such as RSNetWorx for EtherNet to describe products so that you can easily commission them on a network. EDS files describe a product device type and revision. EDS files for many Allen-Bradley products can be found at http://www.ab.com/networks/eds.

EtherNet/IP Network

EtherNet/IP (Industrial Protocol) is an open producer-consumer communication network based on the Ethernet standard (IEEE 802.3), TCP/IP, UDP/IP, and CIP. Designed for industrial communications, both I/O and explicit messages can be transmitted over the network. Each device is assigned a unique IP address and transmits data on the network. The number of devices that an EtherNet/IP network can support depends on the class of IP address. For example, a network with a Class C IP address can have 254 nodes.

General information about EtherNet/IP and the EtherNet/IP specification are maintained by the Open DeviceNet Vendor's Association (ODVA). ODVA is online at http://www.odva.org.

Explicit Messaging

Explicit Messages are used to transfer data that does not require continuous updates. They are typically used to configure, monitor, and diagnose devices over the network.

F

Fault Action

A fault action determines how the adapter and connected drive act when a communications fault (for example, a cable is disconnected) occurs or when the controller is switched out of run mode. The former uses a communications fault action, and the latter uses an idle fault action.

Fault Configuration

When communications are disrupted (for example, a cable is disconnected), the adapter and PowerFlex drive can respond with a user-defined fault configuration. The user sets the data that is sent to the drive using specific fault configuration parameters in the adapter. When a fault action parameter is set to use the fault configuration data and a fault occurs, the data from these parameters is sent as the Logic Command, Reference, and/or Datalink(s).

Flash Update

The process of updating firmware in a device. The adapter can be flash updated using various Allen-Bradley software tools. Refer to Flash Updating the Adapter on page 3-18 for more information.

G

Gateway

A device on a network that connects an individual network to a system of networks. When a node needs to communicate with a node on another network, a gateway transfers the data between the two networks. You need to configure the address for the gateway device in the adapter if you want the adapter to communicate with devices that are not on its network.

H

Hardware Address

Each Ethernet device has a unique hardware address (sometimes called a MAC address) that is 48 bits. The address appears as six digits separated by colons (for example, xx:xx:xx:xx:xx:xx). Each digit has a value between 0 and 255 (0x00 and 0xFF). This address is assigned in the hardware and cannot be changed. It is required to identify the device if you are using a BOOTP utility.

HIM (Human Interface Module)

A device that can be used to configure and control a drive. PowerFlex 7-Class HIMs (20-HIM-xxx) can be used to configure PowerFlex 7-Class drives and their connected peripherals.

Hold Last

When communication is disrupted (for example, a cable is disconnected), the adapter and PowerFlex drive can respond by holding last. Hold last results in the drive receiving the last data received via the network connection before the disruption. If the drive was running and using the Reference from the adapter, it will continue to run at the same Reference.

Host Parameters (PowerFlex 750-Series drives only)

Host parameters are used to configure peripherals connected to a PowerFlex 750-Series drive. Host parameters, when viewed using DriveExplorer or DriveExecutive, appear below the specific peripheral listing in the treeview in a separate Host Parameters folder. When using a PowerFlex 7-Class HIM (20-HIM-A3/-A5/-C3S/-C5S), these parameters do not appear. When viewed using a PowerFlex 750-Series HIM (20-HIM-A6/-C6S), these parameters appear in the HOST PARAM folder.

I

Idle Action

An idle action determines how the adapter and connected drive act when the controller is switched out of run mode.

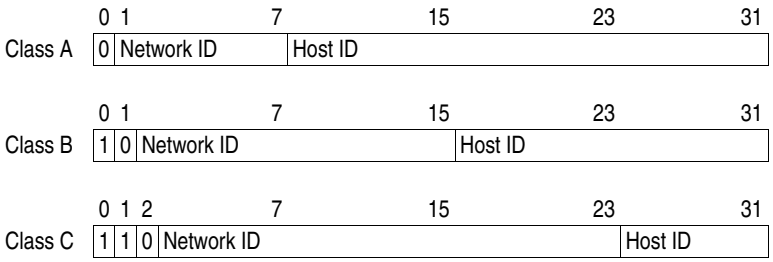
I/O Data

I/O data, sometimes called " implicit messages" or "input/output," is time-critical data such as a Logic Command and Reference. The terms "input" and "output" are defined from the controller's point of view. Output is produced by the controller and consumed by the adapter. Input is produced by the adapter and consumed by the controller.

IP Addresses

A unique IP address identifies each node on an EtherNet/IP network. An IP address consists of 32 bits that are divided into four segments of one byte each. It appears as four decimal integers separated by periods (xxx.xxx.xxx.xxx). Each "xxx" can have a decimal value from 0 to 255. For example, an IP address could be 192.168.0.1.

An IP address has two parts: a network ID and a host ID. The class of network determines the format of the address.



The number of devices on your EtherNet/IP network will vary depending on the number of bytes that are used for the network address. In many cases you are given a network with a Class C address, in which the first three bytes contain the network address (subnet mask = 255.255.255.0). This leaves 8 bits or 256 addresses on your network. Because two addresses are reserved for special uses (0 is an address for the network usually used by the router, and 255 is an address for broadcast messages to all network devices), you have 254 addresses to use on a Class C address block.

To ensure that each device on the Internet has a unique address, contact your network administrator or Internet Service Provider for unique fixed IP addresses. You can then set the unique IP address for the adapter by using a BOOTP server or by manually configuring parameters in the adapter. The adapter reads the values of these parameters only at power-up.

L

Logic Command/Logic Status

The Logic Command is used to control the PowerFlex 7-Class drive (for example, start, stop, direction). It consists of one 16-bit word of output to the adapter from the network. The definitions of the bits in this word depend on the drive, and are shown in Appendix D.

The Logic Status is used to monitor the PowerFlex 7-Class drive (for example, operating state, motor direction). It consists of one 16-bit word of input from the adapter to the network. The definitions of the bits in this word depend on the drive, and are shown in Appendix D.

M

Master-Slave Hierarchy

An adapter configured for a master-slave hierarchy exchanges data with the master device. Usually, a network has one scanner which is the master device, and all other devices (for example, drives connected to EtherNet/IP adapters) are slave devices.

On a network with multiple scanners (called a multimaster hierarchy), each slave device must have a scanner specified as a master.

N

NVS (Non-Volatile Storage)

NVS is the permanent memory of a device. Devices such as the adapter and drive store parameters and other information in NVS so that they are not lost when the device loses power. NVS is sometimes called “EEPROM.”

P

PCCC (Programmable Controller Communications Command)

PCCC is the protocol used by some controllers to communicate with devices on a network. Some software products (for example, DriveExplorer and DriveExecutive) also use PCCC to communicate.

Peer-to-Peer Hierarchy

An adapter that is configured for a peer-to-peer hierarchy can exchange data with a device on the network that is not a scanner. This type of hierarchy can be set up so that a scanner configures or transmits data to one PowerFlex 7-Class drive which then sends the same configuration or data to other PowerFlex 7-Class drives on the network. To use a peer-to-peer hierarchy, you configure one adapter to transmit data (2 or 4 words) and one or more adapters to receive the data.

Ping

A message that is sent by a DPI product to its peripheral devices. They use the ping to gather data about the product, including whether it can receive messages and whether they can log in for control. On EtherNet/IP, a ping can be used to determine if a node exists.

PowerFlex 7-Class (Architecture Class) Drives

The Allen-Bradley PowerFlex 7-Class family of drives supports DPI and, at the time of publication, includes the PowerFlex 70, PowerFlex 700, PowerFlex 700H, PowerFlex 700S, PowerFlex 700L, and PowerFlex 7000.

PowerFlex 750-Series (Architecture Class) Drives

The Allen-Bradley PowerFlex 750-Series of drives supports DPI and, at the time of publication, includes the PowerFlex 753 and PowerFlex 755.

R

Reference/Feedback

The Reference is used to send a setpoint (for example, speed, frequency, torque) to the drive. It consists of one word of output to the adapter from the network. The size of the word (either a 16-bit word or 32-bit word) is determined by the drive.

Feedback is used to monitor the speed of the drive. It consists of one word of input from the adapter to the network. The size of the word (either a 16-bit word or 32-bit word) is determined by the drive.

RSLogix 5/500/5000

RSLogix software is a tool for configuring and monitoring controllers to communicate with connected devices. It is a 32-bit application that runs on various Windows operating systems. Information about RSLogix software can be found at http://www.software.rockwell.com/rslogix.

S

Scanner

A scanner is a separate module (of a multi-module controller) or a built-in component (of a single-module controller) that provides communication with adapters connected to a network. See also Controller.

Status Indicators

Status indicators are LEDs that are used to report the status of the adapter, network, and drive. They are on the adapter and can be viewed on the front cover of the drive when the drive is powered.

Subnet Mask

An extension to the IP addressing scheme that lets you use a single network ID for multiple physical networks. A bit mask identifies the part of the address that specifies the network and the part of the address that specifies the unique node on the network. A “1” in the subnet mask indicates the bit is used to specify the network. A “0” in the subnet mask indicates that the bit is used to specify the node.

For example, a subnet mask on a network may appear as follows: 11111111 11111111 11111111 11000000 (255.255.255.192). This mask indicates that 26 bits are used to identify the network and 6 bits are used to identify devices on each network. Instead of a single physical Class C network with 254 devices, this subnet mask divides it into four networks with up to 62 devices each.

Switches

Network devices that provide virtual connections that help to control collisions and reduce traffic on the network. They are able to reduce network congestion by transmitting packets to an individual port only if they are destined for the connected device. In a control application, in which real time data access is critical, network switches may be required in place of hubs.

T **TCP (Transmission Control Protocol)**

EtherNet/IP uses this protocol to transfer Explicit Messaging packets using IP. TCP guarantees delivery of data through the use of retries.

U **UDP (User Datagram Protocol)**

EtherNet/IP uses this protocol to transfer I/O packets using IP. UDP provides a simple, but fast capability to send I/O messaging packets between devices. This protocol ensures that adapters transmit the most recent data because it does not use acknowledgements or retries.

Z **Zero Data**

When communications are disrupted (for example, a cable is disconnected), the adapter and drive can respond with zero data. Zero data results in the drive receiving zero as values for Logic Command, Reference, and Datalink data. If the drive was running and using the Reference from the adapter, it will stay running but at zero Reference.

PRODUCT PROFILE

Thermistor Monitors

Machine Alert Bulletin Number 817

Protective Functions

- Overtemperature

Advantages

- Microprocessor technology provides highly accurate and repeatable protection
- No adjustments required
- Wide supply voltage rating (24... 240V AC/DC) covers a broad range of applications
- Compact 22.5 mm Euronorm housings
- Global application with CE, CSA and UL approval
- Connection of up-to six PTC thermistors in series
- Type E2 offers unlimited storage of status in event of power failure
- Open and short circuit detection
- Short circuit protected signal input

Typical Applications

- VFD-Controlled Motors
- Transformers
- Bearings
- Heating Systems

Overview

The new MachineAlert family of dedicated function electronic motor protection relays offers state-of-the-art supplementary protective functions that are easily added and applied to motor control circuits. A full range of products exists to allow selective addition of motor protective enhancing functions to meet specific application requirements. The MachineAlert relays are an economical choice for protecting equipment investments and minimizing production downtime.

Bulletin 140M Motor Protection Circuit Breakers

- Current Range 0.1…630 A
- UL Listed for Motor Loads
  - – Short Circuit Protection
  - – Overload Protection
- Visible Trip Indication
- High Current Limiting
- High Switching Capacity

The Bulletin 140M Motor Protection Circuit Breakers provide short circuit and overload protection for individual motor loads. Factory-installed internal accessories make installation and wiring easy.

Your order must include: cat. no. of the Motor Protection Circuit Breaker selected and, if required, cat. no. of any accessories.

General Information

Motor Protection Circuit Breakers may provide the following protective and control functions.

- Disconnect for Motor Branch Circuit
- Branch-Circuit, Short-Circuit Protection (Magnetic Protection)
- Overload Protection (Thermal Protection)
- Switching (Manual)

In North America, electrical codes require that an individual Motor Branch Circuit be protected by a UL/CSA Listed Fuse, Circuit Breaker or Self-Protected Combination Motor Controller.

140M-C, D and F Frames:

The 140M-C, D and F frame Motor Protection Circuit Breakers may have 2 cULus Listings – as Manual, Self-Protected Combination Motor Controllers and as Manual Motor Controllers (with optional approvals for Motor Disconnect and Group Installation).

When UL/CSA listed as Manual, Self-Protected Combination Motor Controllers, the 140M Motor Protection Circuit Breakers provide all of the necessary NEC/CEC requirements for the protection and control of individual Motor Branch Circuits without additional protective devices.

At some higher voltages and currents (particularly at 600V), a few of the 140M-C, D and F frame devices are only UL/CSA Listed as Manual Motor Controllers (with optional approvals for Motor Disconnect and Group Installation). In NEC/CEC Group Installations, these devices must be applied per the appropriate rules which require the use of an upstream Branch-Circuit, Short-Circuit Protective Device (BCPD). See the table on page 2-17 for the specific ratings of each Motor Protection Circuit Breaker.

140-CMN Frame:

The 140-CMN frame Motor Protection Circuit Breakers are UL Listed/CSA Certified as Manual Motor Controllers (with optional approvals for Motor Disconnect and Group Installation). In NEC/CEC Group Installations, these devices must be applied per the appropriate rules which require the use of an upstream Branch-Circuit, Short-Circuit Protective Device (BCPD). See the table on page 2-17 for the specific ratings of each Motor Protection Circuit Breaker.

140M-I, J and L Frames:

The 140M-I, J and L frame Motor Protection Circuit Breakers are cULus Listed as Circuit Breakers as shown in the table on page 2-9. In these cases, the 140M Motor Protection Circuit Breakers provide all of the necessary NEC/CEC requirements for the protection and control of individual Motor Branch Circuits without additional protective devices.

For further details on the proper application of Motor Protection Circuit Breakers, please see the diagrams on the following pages.

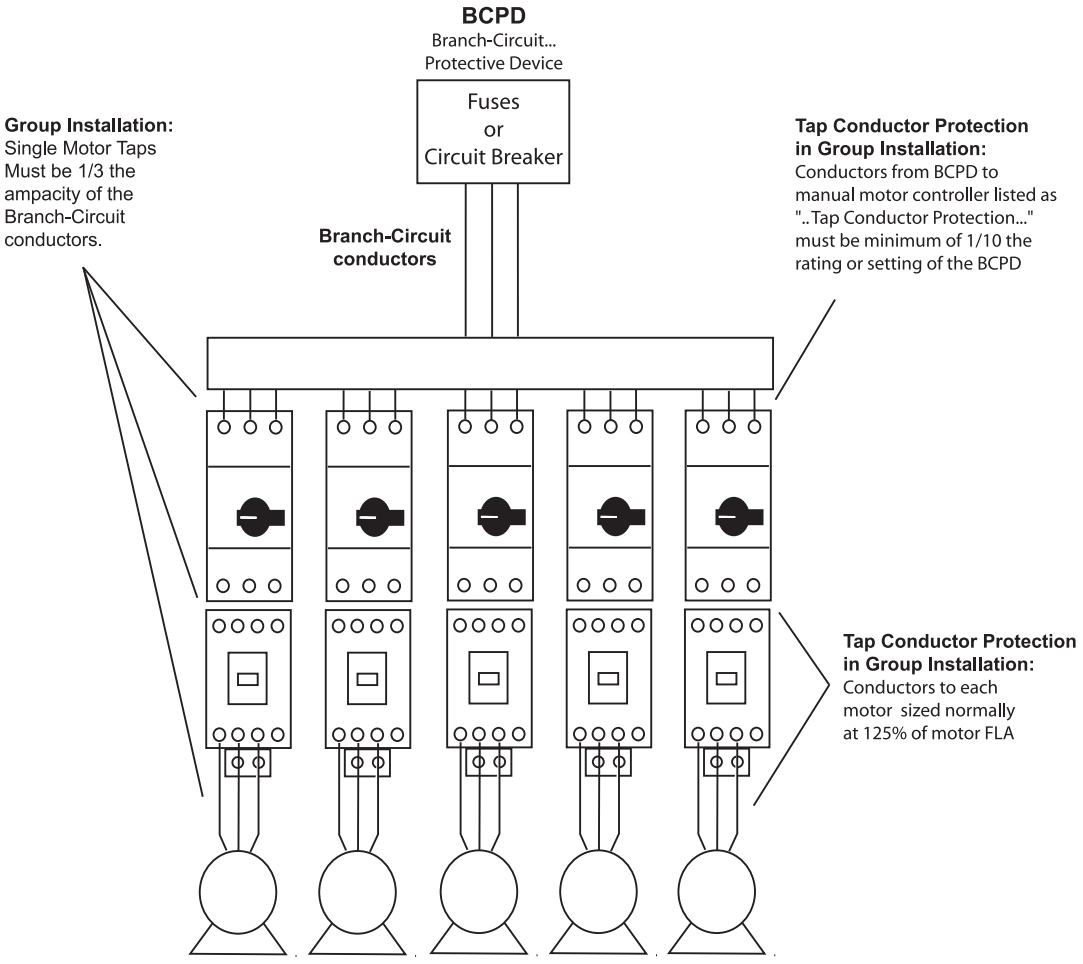
Group Installation with MPCBs

There is only one Branch Circuit Protective Device (BCPD) for the "Group"

Group Installation has been successfully used for many years in the U.S and Canada. It allows "two or more motors or one or more motors and other loads to be connected to the same branch-circuit...". The most restrictve part of the conditions specified for Group Installation is the requirement for the protection of the conductors for each motor circuit. In the U.S. NEC for 2002, a new rule for the conductor sizing was added for devices that are listed and marked "Suitable for use as Tap Conductor Protection". Below is an example that illustrates installations involving multiple motors with a single BCPD protecting the entire "Group".

Bulletin 140M Motor Protection Circuit Breakers UL/CSA listed for Group Installation
Conductors from the BCPD to each motor must be a minimum of 1/3 the ampacity of the Branch-Circuit conductors.

Bulletin 140M Motor Protection Circuit Breakers UL/CSA listed for Tap Conductor Protection in Group Installations.
Conductors from the BCPD to manual motor controller listed as "..Tap Conductor Protection..." must be minimum of 1/10 the rating or setting of the BCPD. Conductors from the controller to the motor must be 125% of the motor FLA.



Group Motor Installation

3-Phase Power Supply

Multiple Motor Installation with MPCBs

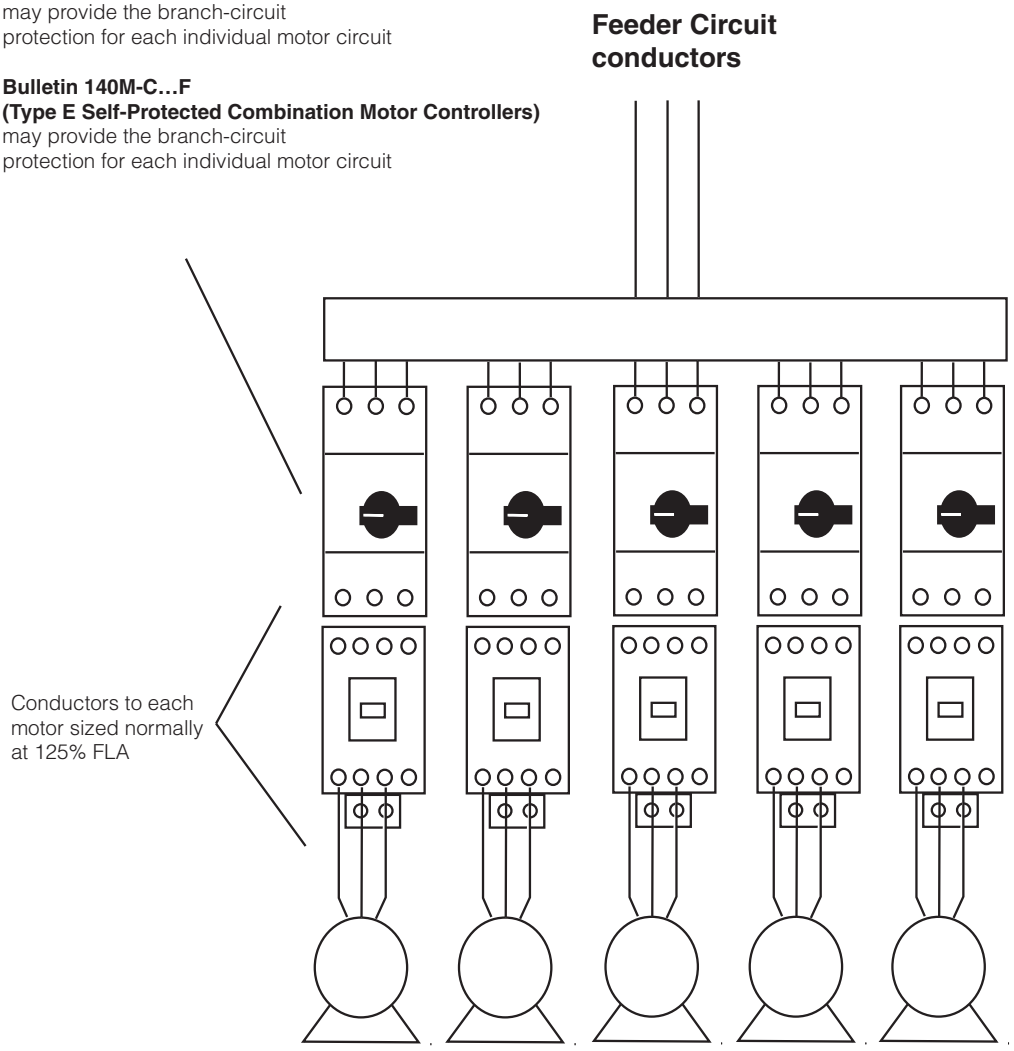
Each Motor has an Individual Branch Circuit Protective Device

Bulletin 140M Motor Protection Circuit Breakers (MPCBs) UL/CSA Listed as Type E Manual Self-Protected Combination Motor Controllers or UL/CSA Listed as Circuit Breakers

These UL/CSA Listings allow the Bulletin 140M MPCBs to provide the branch-circuit, short-circuit protection (as well as overload protection) for each individual motor circuit. Additional short-circuit protection is not required for the protection of the individual motor cuircuits, leaving only the requirement for protection of the feeder circuit conductors by an upstream protective device. Below is an example that illustrates installations involving multiple motors, each with its own branch-circuit protection (BCPD).

Bulletin 140M-J…L
(Inverse Time Circuit Breakers)
may provide the branch-circuit protection for each individual motor circuit

Bulletin 140M-C…F
(Type E Self-Protected Combination Motor Controllers)
may provide the branch-circuit protection for each individual motor circuit



Multi-Motor Installation

Type E and Type F Combination Motor Controllers

Most of the 140M-C…F motor protection circuit breakers are UL listed as a manual Type E self-protected combination motor controller. Although there are many tests involved, one of the critical tests a self-protected combination motor controller must pass, is to perform 6000 electrical ops. and an additional 4000 mechanical ops. after a short circuit.

By definition, a **Type F** combination motor controller consists of a Type E manual self protected combination motor controller and a magnetic or solid-state motor controller (such as a Bulletin 100-C contactor or an SMC). As with a manual Type E self-protected combination motor controller, additional short-circuit protection is not required for the individual motor circuits.

A combination of a Bulletin 140M manual self protected combination motor controller and 100-C contactor can be listed as a **Type E** self-protected combination motor controller. In this case, both the 140M and 100-C must pass the additional 6000 electrical and 4000 mechanical operational test. In some cases, this may require over sizing of the Bulletin 140M MPCB or the 100-C contactor to achieve weld free performance and meet the additional life requirements.

General Information

Motor Circuit Protectors may provide the following protective and control functions.

- Disconnect for Motor Branch Circuit
- Branch-Circuit, Short-Circuit Protection (Magnetic Protection)
- Switching (Manual)

In North America, electrical codes require that an individual Motor Branch Circuit be protected by a UL/CSA Listed Fuse, Circuit Breaker or Self-Protected Combination Motor Controller.

140M-C, D and F Frames:

The 140M-C, D and F frame Motor Circuit Protectors have one UL/CSA Listing – as Manual Motor Controllers (with optional approvals for Motor Disconnect and Group Installation). In NEC/CEC Group Installations, these devices must be applied per the appropriate rules which require the use of an upstream Branch-Circuit, Short-Circuit Protective Device (BCPD). See the table on page 2-19 for the specific ratings of each Motor Circuit Protector.

The 140M-C, D and F Frame Motor Circuit Protectors are also UL/CSA Listed, together with a Bulletin 100C contactor and Bulletin 193 overload relay, as part of our Bulletin 103T and 107T Self-Protected IEC Combination Starters. These starters are then able to provide all of the necessary NEC/CEC requirements for the protection and control of individual Motor Branch Circuits without additional protective devices.

140M-H, J and L Frames:

The 140M-H, J and L frame Motor Circuit Protectors are UL/CSA Recognized as Circuit Breakers as shown in the table on page 2-19. They are UL/CSA Recognized, rather than UL/CSA Listed, since they only provide short circuit protection and not thermal overload protection for the motor.

140M-H, J and L frame Motor Circuit Protectors (MCPs) are also UL/CSA Listed, together with a Bulletin 100C contactor and Bulletin 193 overload relay, as part of our Bulletin 113 IEC Combination Starters. These starters are then able to provide all of the necessary NEC/CEC requirements for the protection and control of individual Motor Branch Circuits without additional protective devices.

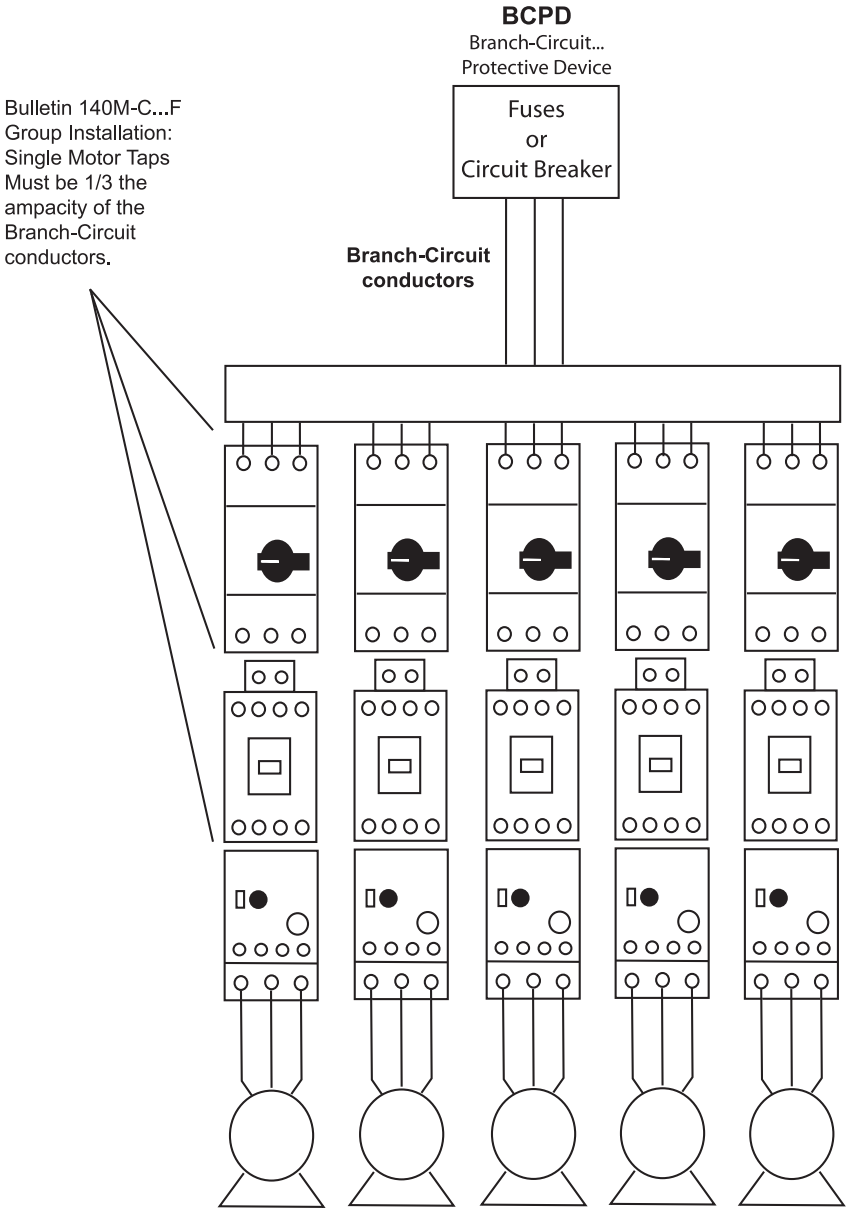
Group Installation with MCPs

There is only one Branch Circuit Protective Device (BCPD) for the "Group"

Group Installation has been successfully used for many years in the U.S and Canada. It allows "two or more motors or one or more motors and other loads to be connected to the same branch-circuit...". The most restrictve part of the conditions specified for Group Installation is the requirement for the protection of the conductors for each motor circuit.
Below is an example that illustrates installations involving multiple motors with a single BCPD protecting the entire "Group".

Bulletin 140M Motor Circuit Protectors UL/CSA listed for Group Installation

Conductors from the BCPD to each motor must be a minimum of 1/3 the ampacity of the Branch-Circuit conductors.
Motor Circuit Protectors do not provide thermal protection, so a separate Overload Relay must be used.
Therefore, MCP's cannot be UL/CSA listed for Tap Conductor Protection in Group Installations.



Group Motor Installation

3-Phase Power Supply

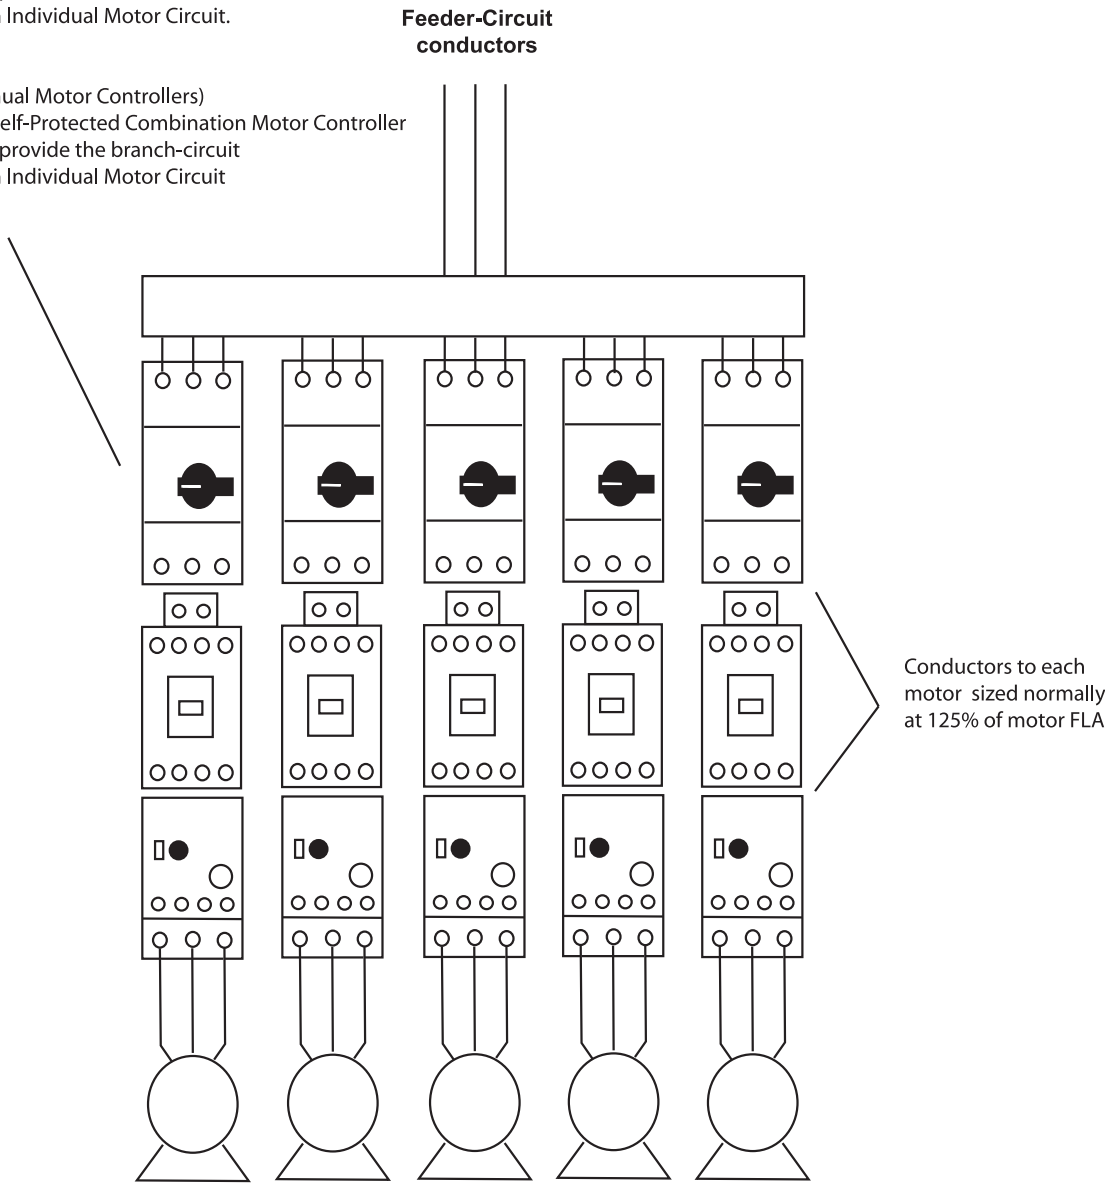
Multiple Motor Installation with MCPs

Each Motor has an Individual Branch Circuit Protective Device (BCPD)

Bulletin140M Motor Circuit Protectors are UL/CSA listed as part of a Combination Motor Controller or a Self-Protected Combination Motor Controller consisting of a 140M Motor Circuit Protector, a 100C Contactor and a 193 Overload Relay.
These UL/CSA listings allow the Bulletin 140M MCP's to provide the branch-circuit, short-circuit protection for each individual motor circuit. Additional short-circuit protection is not required for the protection of the individual motor circuits, leaving only the requirement for protection of the Feeder-Circuit conductors by an upstream protective device.
Below is an example that illustrates installations involving multiple motors, each with their own branch-circuit protection (BCPD).

Bulletin 140M-H..N
(UL/CSA recognized Instantaneous Trip Circuit Breakers)
As part of a listed Combination Motor Controller
these devices may provide the branch-circuit
protection for each Individual Motor Circuit.

Bulletin 140M-C..F
(UL/CSA listed Manual Motor Controllers)
As part of a listed Self-Protected Combination Motor Controller
these devices may provide the branch-circuit
protection for each Individual Motor Circuit



Multi-Motor Installation

Motor Circuit Protectors

- Short-circuit protection — standard magnetic trip (fixed at 13 x I_e)
- Overload protection — none (magnetic trip only)
- For Trip Class 10 motor applications‡

∗ The Hp and kW ratings shown are for reference only. They allow for a magnetic trip setting of at least up to 13X the motor FLA. However, the final selection of the MCP should be made based on motor full load current and the requirements of local electrical codes.

❄ The interrupting rating for MCPs is dependent upon the controller used. Please contact your local Rockwell Automation sales office or Allen-Bradley distributor

2

Definition of Type 2 Short Circuit Coordination:

- The contactor or starter must not endanger persons or plant in the event of a short circuit.
- No damage to the motor protection device or other parts may occur with the exception of welding of the contactor or starter contacts if these can be easily separated without appreciable deformation (such as with a screwdriver).

In the event of short circuit, fast-opening, current-limiting Bulletin 140M Motor Protection Circuit Breakers make it possible to build economical, fully short-circuit coordinated starter combinations with Type 2 coordination.

	Description		For Use With	Cat. No.
	Anti-Tamper Shield Provides protection against inadvertent adjustment of the current setting	10 pcs/pkg	140M-C, D, F	**140M-C-CA**
	Lockable Twist Knob For 1 padlock 4…6 mm (1/4 in.) dia. shackle Can be locked in OFF position	Black	140M-C, D, F	**140M-C-KN**
		Red/Yellow	140M-C/-D	**140M-C-KRY**
		Red/Yellow	140M-F	**140M-F-KRY**
	Padlockable Operating Knob Accepts 8 mm (5/16 in.) padlock — up to three padlocks Permits padlocking in the off position	Black	140-CMN	**140-KN**
		Red/Yellow		**140-KRY**
	Door Coupling Handle For 3 padlocks 4…8 mm (5/16 in.) in diameter IP66 Protection/Type 1, 4, 4X, 12 Interlock override capability Can be modified for locking in ON position Ships with coupling — order extension shaft and legend plate separately Mounting depth (adapter-door): 140-C: 105.5 mm ± 5 mm (4.5 in. ± 3/16 in.) 140-D: 114.5 mm ± 5 mm (4.5 in. ± 3/16 in.) 140-F: 137.1 mm ± 5 mm (5.4 in. ± 3/16 in.)	Black	140M-C, D, F	**140M-C-DN66**
			140-CMN	**140-CDN66**
		Red/Yellow	140M-C, D, F	**140M-C-DRY66**
			140-CMN	**140-CDRY66**
	Extension Shaft Cut to required length for mounting depth (adapter-door): 140M-C: 117…338 mm (4.6 in.…13.3 in.) 140M-D: 126…347 mm (5.0 in.…13.7 in.) 140M-F: 149…369 mm (5.4 in.…14.5 in.) 140-CMN: 180…403 mm (7.1 in.…15.9 in.)		140M-C-DN66, 140M-C-DRY66, 140-CDN66, 140-CDRY66	**140M-C-DS**
	Extension Shaft (Extended Length) Cut to required length for mounting depth (adapter-door): 140M-C: 117…488 mm (4.6…19.2 in.) 140M-D: 126…497 mm (5.0…19.6 in.) 140M-F: 149…519 mm (5.4…20.4 in.) 140-CMN: 180…553 mm (7.1…21.8 in.)		140M-C-DN66, 140M-C-DRY66, 140-CDN66, 140-CDRY66	**140M-C-DSL**
	Coupler Included with Cat. Nos. 140M-C-DN66 and 140M-C-DRY66		140M-C, D, F	140M-C-DNC
	Legend Plate Marking: "Hauptschalter" and "Main Switch" Marking: "Not-Aus" and "Emergency Off"		140-CDN66	**140M-C-DFCN**
			140-CDRY66	**140M-C-DFCRY**
	Locking Tag Padlock attachment to the lockable handles Up to three padlocks 4…8 mm (5/16 in.) shackle		140M-C-KN 140M-C-KRY 140M-F-KRY	**140M-C-M3**
	IP65 Non-Metallic Enclosure Knockouts for M20 and M25 fittings Suitable for flexible cable with internal ground wire or conduit when externally grounded around the outside of the enclosure (no UL approval)	Black Handle	140M-C	**198E-AYTG2**
		Red/Yellow Handle	140M-C	**198E-AYTJ2**
	Terminal Cover For covering of unused commoning link terminals IP2X finger protection		140M-C, 140M-D	**140M-C-WS**
			140M-F	140M-F-WS
	Screw Adapter For screw arrangement of a Motor Protection Circuit Breaker	10 pcs/pkg	140M-C, D, F	**140M-C-N45**

Motor Protection Circuit Breakers and Motor Circuit Protectors

Accessories, Continued

	Description		For Use With	Cat. No.
	ECO Connecting Module — 12 A For DOL and reversing starters Eco-starters mount on single DIN Rail (140M on DIN Rail) Electrical and mechanical interconnection of 140M MPCB and 100-K contactors		140M-C to 100-K	**140M-C-PEK12**
	ECO Connecting Modules — 25 A Eco-starters mount on single DIN Rail (140M on DIN Rail) Electrical and mechanical interconnection of 140M MPCB and 100-C (with AC coils or 24V DC electronic coils) contactors		140M-C to 100-C09…C23	**140M-C-PEC23**
			140M-D to 100-C09…C23	**140M-D-PEC23**
	Connecting Modules — 25 and 45 A Contactor and MPCB **MUST BE** mounted separately on (2) DIN Rails Electrical interconnection between 140M MPCB and 100-C contactors (with AC coils)		140M-C to 100-C09…C23	**140M-C-PNC23**
			140M-D to 100-C09…C23	**140M-D-PNC23**
			140M-D to 100-C30…C37	**140M-D-PNC37**
			140M-F to 100-C30…C37	**140M-F-PNC37**
			140M-F to 100-C43	**140M-F-PNC43**
	Coil Modules — 25 A and 45 A • For use with Bulletin 103T/107T 3-component starters		140M-C, -D to 100-C09…C23	140M-C-PSC23
			140M-D, -F to 100-C30…C43	140M-F-PSC43
	Spacing Adapter Required for Self-Protected combination motor controller (Type E) applications of Bul. 140M-C, -D, and -F MPCBs		140M-C, -D	**140M-C-TE1**
			140M-F	**140M-F-TE**
	Compact Busbar Feeder Block Supply of compact busbars Increases terminal capacity		140M-C, -D	**140M-C-WBE**
			140M-F	**140M-F-WBE**
	Compact Busbar Feeder Terminal For supply of commoning links Top feed — overlaps commoning link Meets UL Type E spacing requirements		140M-C, -D	**140M-C-WTE**
			140M-F	**140M-F-WTE**
	Three-Phase Compact Busbar for 25 A Motor Protection Circuit Breakers — 63 A Max. Continuous Current 45 mm spacing For use with front-mounted auxiliary contact	2 connections	140M-C, -D	**140M-C-W452**
		3 connections		**140M-C-W453**
		4 connections		**140M-C-W454**
		5 connections		**140M-C-W455**
	Three-Phase Compact Busbar for 25 A Motor Protection Circuit Breakers — 63 A Max. Continuous Current 54 mm spacing For use with side-mounted auxiliary contact	2 connections	140M-C, -D	**140M-C-W542**
		3 connections		**140M-C-W543**
		4 connections		**140M-C-W544**
		5 connections		**140M-C-W545**
	Three-Phase Compact Busbar for 25 A Motor Protection Circuit Breakers — 63 A Max. Continuous Current 63 mm spacing For use with side-mounted undervoltage trip and shunt trip	2 connections	140M-C, -D	**140M-C-W632**
		3 connections		**140M-C-W633**
		4 connections		**140M-C-W634**
		5 connections		**140M-C-W635**
	Jumper for 140M-D to 140M-C Accommodates difference in depth from Bul. 140M-D to 140M-C 54 mm spacing Can be used with all other commoning links	2 connections	140M-D to 140M-C	**140M-C-WD542**
	Three-Phase Compact Busbar for 45 A Motor Protection Circuit Breakers — 115 A Max. Continuous Current 54 mm spacing For use with front-mounted auxiliary contact	2 connections	140M-F	**140M-F-W542**
		3 connections		**140M-F-W543**
		4 connections		**140M-F-W544**
	Three-Phase Compact Busbar for 45 A Motor Protection Circuit Breakers — 115 A Max. Continuous Current 63 mm spacing For use with side-mounted auxiliary contact	2 connections	140M-F	**140M-F-W632**
		3 connections		**140M-F-W633**
		4 connections		**140M-F-W634**
	DIN (#3) symmetrical Rail 35 mm x 7.5 mm x 1 m long	10 pcs/kg	140M-D 140M-F	**199-DR1**
	DIN (#3) Symmetrical Rail 35 mm x 15 mm x 1 m long Top Hat Rail (DIN #3 Symmetrical Rail)	5 pcs/kg	140M-C 140M-D 140M-F 140-CMN	**1492-DR9**

Notes: 1. See Bulletin 140U for Internal and External Accessories for Bulletin 140M-H, J, L and N frames.

2. Bulletin 140M-I frame Accessories such as auxiliaries, alarms, undervoltage and shunt trips are only available as factory installed modifications. See page 33.

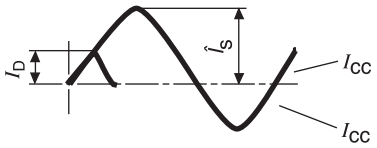
Cut-off current



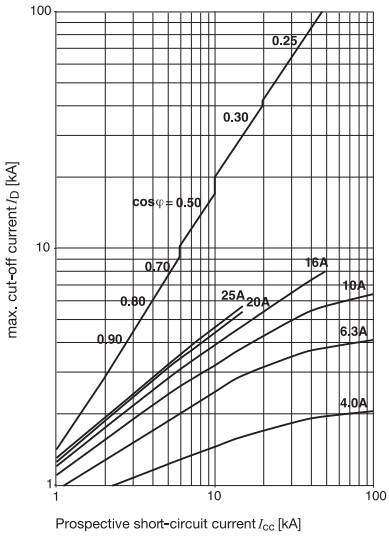
asymmetrical

symmetrical

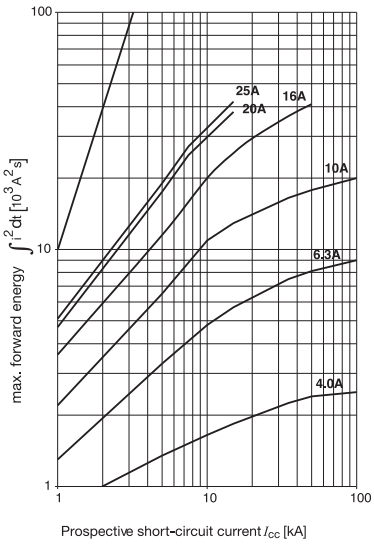
The Bulletin 140-M limits solid short-circuit current I_{CC} (prospective short-circuit current). ID is the maximum cut-off current (highest instantaneous value of the limited short-circuit current). This value is indicated in the following diagrams as a function of the progressive system short-circuit current.

Bulletin 140M-C Circuit Breaker

Maximum cut-off current
Rated operating voltage 415V

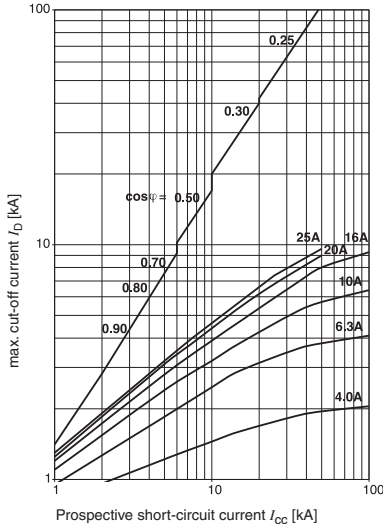


Maximum forward energy
Rated operating voltage 415V

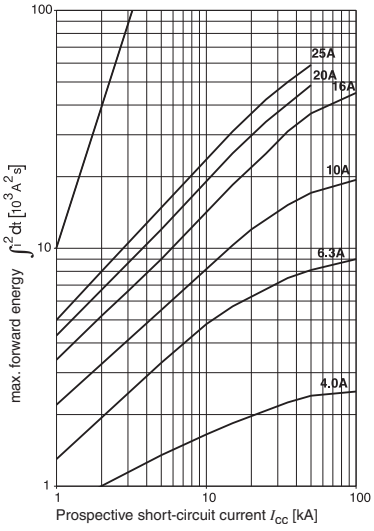


Bulletin 140M-D Circuit Breaker

Maximum cut-off current
Rated operating voltage 415V



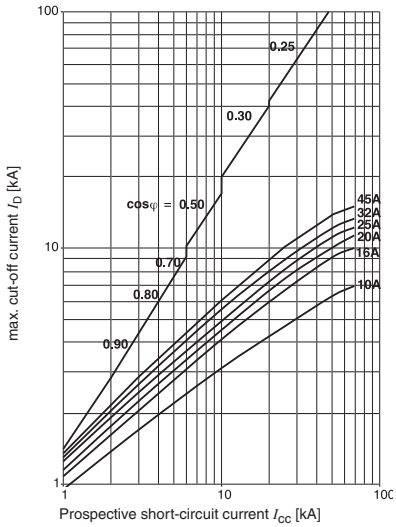
Maximum cut-off current
Rated operating voltage 415V



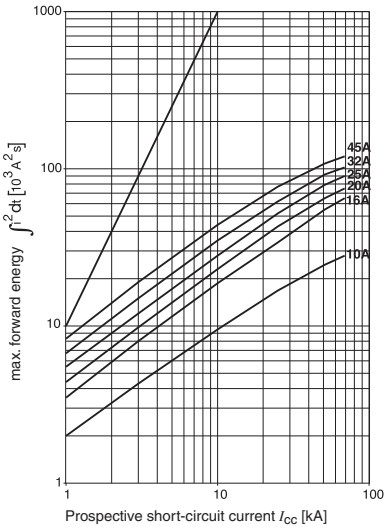
2

Bulletin 140M-F Circuit Breaker

Maximum cut-off current
Rated operating voltage 415V

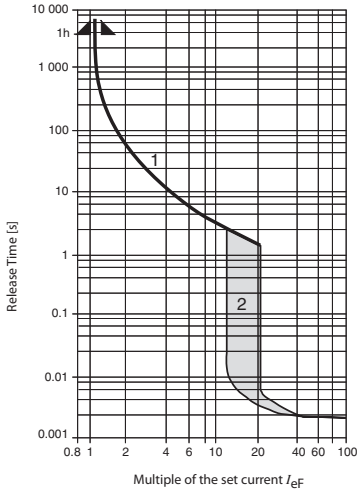


Maximum cut-off current
Rated operating voltage 415V

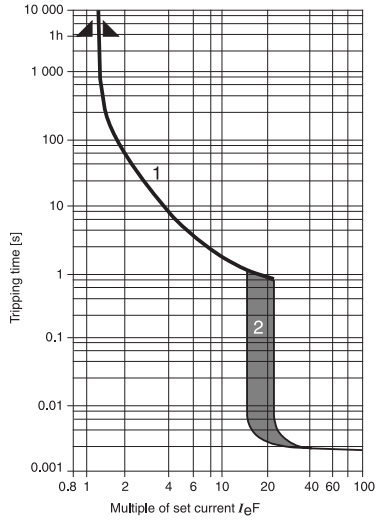


Time-Current Characteristic

Bulletin 140M-C, -D, -F Motor Protection Circuit Breakers



Bulletin 140-CMN Motor Protector



1) Thermal Release Trip Current

The adjustable current-dependent delayed bimetal release protects motors against overload. The curve shows the mean operating current at an ambient temperature of 20 °C starting from the cold state. Careful testing and setting ensures effective motor protection even in the case of single-phasing. The overload characteristic is also valid for transformer protection.

2) Magnetic Release Trip Current

The instantaneous magnetic trip has a fixed operating current setting. This corresponds to 13 times the maximum value of setting range. (Transformer protection up to 20 x I_e max.) At a lower setting it is correspondingly higher.

Current Setting I_{eF}

The overload trip corresponds to a thermal overload relay in a motor starter conforming to IEC947-4-1. If a different value is prescribed (e.g., reduced I_e for cooling medium having a temperature higher than 40 °C or a place of installation higher than 2000 m above sea level), the setting current is equal to the reduced rated current I_e of the motor.

Accessories — 125 A, H-Frame

Internal Control Modules — Field Installed

	Description		Diagram	Mounting Location	Cat. No.
	Auxiliary Contact (AX) Electrically indicates "ON/OFF" status of breakers	(1) 1a-1b		 ***Left AND Right side***	**140U-H-EA1**
		(2) 1a-1b			**140U-H-EA2**
	Alarm Contact (AL) Electrically indicates when the breaker is in the "TRIPPED" state	(1) 1M (make)-1B (break)		 ***Right side ONLY***	**140U-H-ER1**
	Auxiliary/Alarm Contact (AX/AL) Combination Combination of auxiliary contact and alarm contact	(1) 1a-1b (1) 1M (make)-1B (break)		 ***Right side ONLY***	**140U-H-EA1R1**
	Shunt Trip (SNT) Provides remote tripping of the circuit breaker Undervoltage trip not available when shunt trip is used	12V DC		 ***Left side ONLY***	140U-H-SNZQ
		24…60V, 50/60/DC			**140U-H-SNJ**
		110…240V, 50/60/DC			**140U-H-SND**
		380…440V AC, 220…250V DC			140U-H-SNN
		380…600V, 50/60 Hz			140U-H-SNB
	Undervoltage Release (UVT) Automatically trips breaker when voltage falls between preset value, 35…70% Shunt trip is not available when undervoltage release is used	24V, 50/60 Hz		 ***Left side ONLY***	**140U-H-UJ**
		110…127V, 50/60 Hz			**140U-H-UD**
		208…240V, 50/60 Hz			**140U-H-UA**
		380…500V, 50/60 Hz			**140U-H-UB**
		525…600V, 50/60 Hz			140U-H-UC

Note: For Factory-Installed internal control modules, please see page 2-92

			10 ft (3.0 m) Cable	140U-J-FCS10
	Rotary, Variable-Depth Operating Mechanism UL Type 3/12/4/4X, IP 66 Rotary handle 12 in. (30.48 cm) operating rod		Black Handle	**140U-J-RVM12B**
			Red/Yellow Handle	**140U-J-RVM12R**
	Rotary, Variable-Depth Operating Mechanism UL Type 3/12/4/4X, IP 66 Rotary handle 21 in. (53.34 cm) operating rod		Black Handle	140U-J-RVM21B
			Red/Yellow Handle	140U-J-RVM21R
	Rotary, Variable-Depth Operating Mechanism with Internal NFPA 79 Operating Handle Type 3/4/4X/12 IP66 Rotary Handle 12 in. (30.48 cm) operating rod		Black Handle	140U-J-NVM12B
			Red/Yellow Handle	140U-J-NVM12R
	Rotary, Variable-Depth Operating Mechanism with Internal NFPA 79 Operating Handle Type 3/4/4X/12 IP66 Rotary Handle 21 in. (53.34 cm) operating rod		Black Handle	140U-J-NVM21B
			Red/Yellow Handle	140U-J-NVM21R
	Rotary, Direct Couple Operating Mechanism Breaker mounted		Black Handle	**140U-J-RCB**
			Red/Yellow Handle	**140U-J-RCR**
	End Cap Kit Provides 3-phase connections for terminal or bolt-on connections Metric hardware			**140U-J-ECM**
	Phase Barriers Provides additional phase clearance when special connections that extend past the circuit breaker housing are required		Qty: 2	**140U-J-PB**
	Padlock Kit Padlocking hasp Lock-OFF only		Qty: 1	**140U-J-PL**
	Multi-Tap Terminal Lug Kit — with IP20 terminal cover	(3) #14…#2 AWG or (3) 2.5…25 mm²	Qty: 3	**140U-J-MTL3A**
		(6) #14…#6 AWG or (6) 2.5…10 mm²	Qty: 3	**140U-J-MTL6A**
	Ground Fault Leakage Module Current pickup settings are selectable from 0.03…10 A with time delays up to. Time delays are also selectable from Instantaneous…1.0 s for 0.10 A settings and above. A current pickup setting of 0.03 A defaults to an Instantaneous time setting regardless of the time dial's position. Two alarm contacts come as standard: a 50% pretrip and a 100% after trip contact, both based only on earth leakage current levels.	150 A	For use with J-Frame 3 pole MCCBs up to 150 A	**140U-J-GFP1503**
		250 A	For use with J-Frame 3-pole MCCBs up to 250 A	140U-J-GFP2503
	Motor Operator Remotely opens, closes, and resets the circuit breaker 110…240V AC		For use with 3- or 4-Pole MCCBs, 110…240V AC/DC	140U-J-EOPD
			For use with 3- or 4-Pole MCCBs, 24V DC	140U-J-EOPZ
	Mounting Hardware (4) M4 - 0.7 x 90 mm		For use with 3- or 4-Pole MCCBs	140U-J-MHM

Dimensions are in inches (millimeters). Dimensions are not intended to be used for manufacturing purposes.

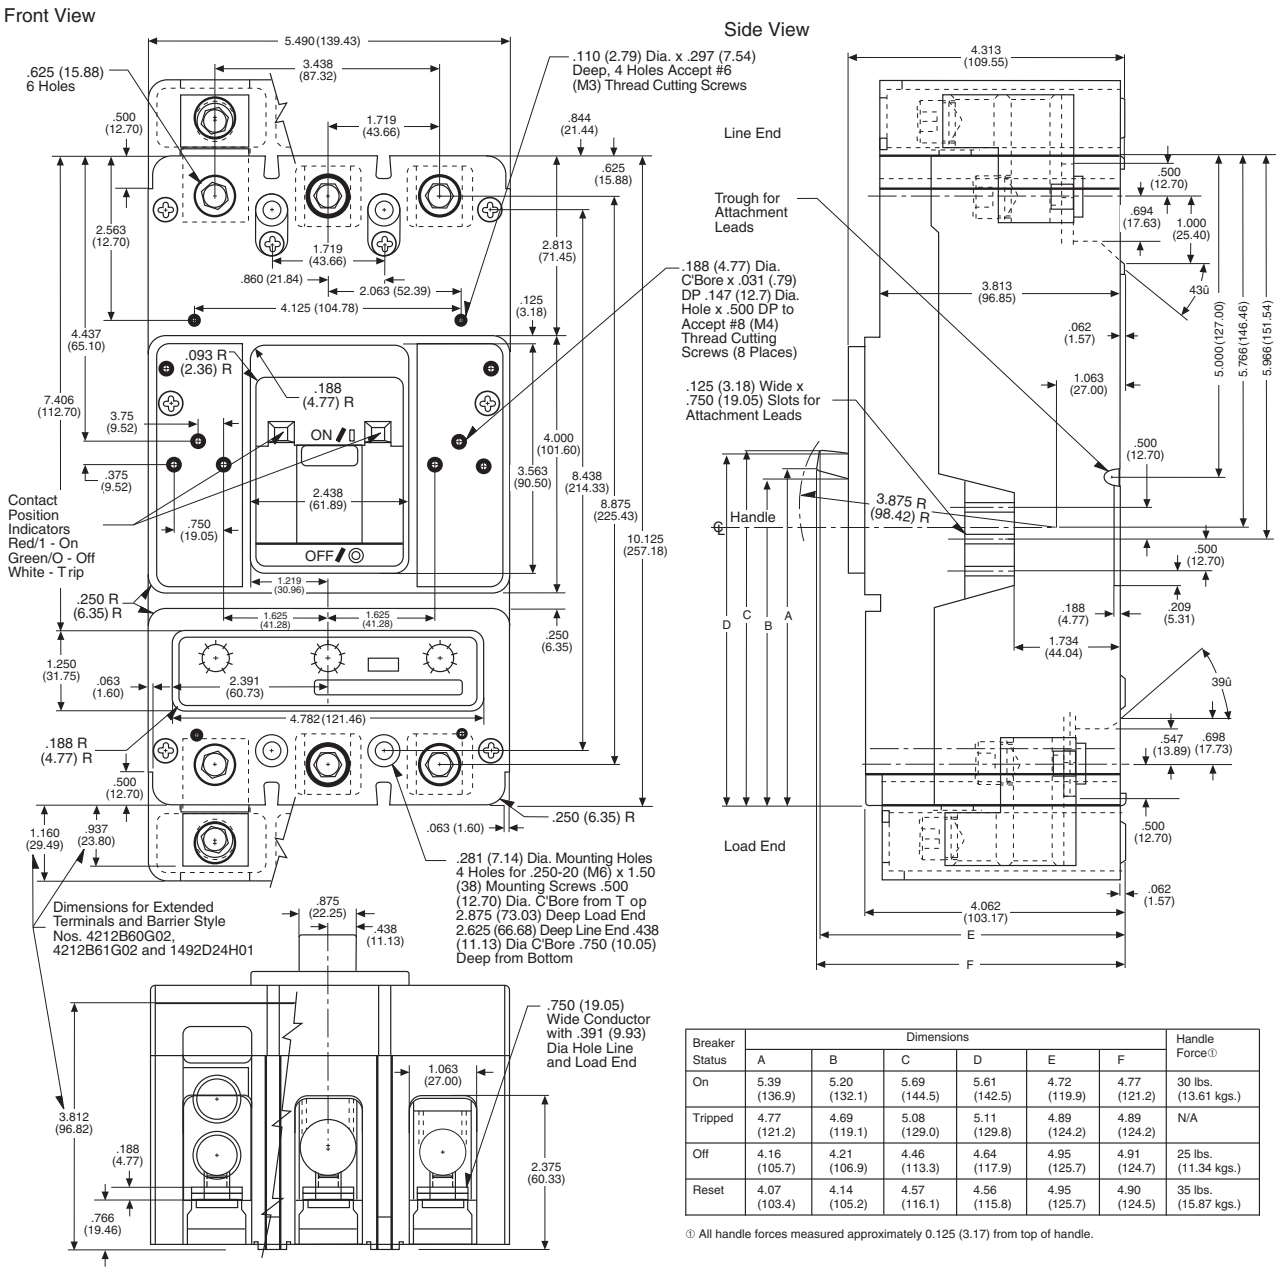
		10 ft (3.0 m) Cable	140U-K-FCS10
	Rotary, Variable-Depth Operating Mechanism UL Type 3/12/4/4X, IP 66 Rotary handle 12 in. (30.48 cm) operating rod	Black Handle	**140U-K-RVM12B**
		Red/Yellow Handle	**140U-K-RVM12R**
	Rotary, Variable-Depth Operating Mechanism UL Type 3/12/4/4X, IP 66 Rotary handle 21 in. (53.34 cm) operating rod	Black Handle	**140U-K-RVM21B**
		Red/Yellow Handle	140U-K-RVM21R
	Rotary, Variable-Depth Operating Mechanism with Internal NFPA 79 Operating Handle UL Type 3/12/4/4X, IP 66 Rotary Handle 12 in. (30.48 cm) operating rod	Black Handle	140U-K-NVM12B
		Red/Yellow Handle	140U-K-NVM12R
	Rotary, Variable-Depth Operating Mechanism with Internal NFPA 79 Operating Handle UL Type 3/12/4/4X, IP 66 Rotary Handle 21 in. (53.34 cm) operating rod	Black Handle	140U-K-NVM21B
		Red/Yellow Handle	140U-K-NVM21R
	Rotary, Direct Couple Operating Mechanism Type 1 Rotary Handle Breaker Mounted	Black Handle	**140U-K-RCG**
	Rotary, Direct Couple Operating Mechanism Type 1 Rotary Handle Breaker Mounted	Red/Yellow Handle	140U-K-RCR
	End Cap Kit Provides 3-phase connections for terminal or bolt-on connections Metric Hardware	Qty: 1	**140U-K-ECM**
	Phase Barriers Provides additional phase clearance when special connections that extend past the circuit breaker housing are required	Qty: 2	**140U-K-PB**
	Mounting Hardware (4) M6 - 1.0 x 45 mm	1	140U-K-MHM

Molded Case Circuit Breakers

Approximate Dimensions — 400 A, K-Frame

Dimensions are in inches (millimeters). Dimensions are not intended to be used for manufacturing purposes.



Breaker Status	Dimensions						Handle Force①
	A	B	C	D	E	F	
On	5.39 (136.9)	5.20 (132.1)	5.69 (144.5)	5.61 (142.5)	4.72 (119.9)	4.77 (121.2)	30 lbs. (13.61 kgs.)
Tripped	4.77 (121.2)	4.69 (119.1)	5.08 (129.0)	5.11 (129.8)	4.89 (124.2)	4.89 (124.2)	N/A
Off	4.16 (105.7)	4.21 (106.9)	4.46 (113.3)	4.64 (117.9)	4.95 (125.7)	4.91 (124.7)	25 lbs. (11.34 kgs.)
Reset	4.07 (103.4)	4.14 (105.2)	4.57 (116.1)	4.56 (115.8)	4.95 (125.7)	4.90 (124.5)	35 lbs. (15.87 kgs.)

① All handle forces measured approximately 0.125 (3.17) from top of handle.

Bulletin 100-K/104-K IEC Contactors

- Compact size
- Same dimensions for AC and DC
- Full-voltage non-reversing and reversing contactors
- 5, 9, and 12 A contactors rated at 690V
- IP2X finger protection
- Optional integrated surge suppressor
- Compatible with Bulletin 193-K bimetallic overload relay
- Mirror contacts per IEC 60947-4-1 and mechanically linked contacts per IEC 60947-5-1 on main unit

Allen-Bradley Bulletin 100-K miniature contactors are designed for commercial and light industrial applications where panel space is at a premium. These miniature devices, while 45 mm wide, are shallower and have less panel depth requirements than standard IEC contactors.

The miniature contactors have been designed with flexibility in mind. They are available with AC or DC operating coils, several contact ratings, and optional 2- or 4-pole adder decks in a variety of auxiliary contact configurations.

Your order must include: cat. no. (with coil voltage code) of the mini contactor specified and, if required, cat. no. of any accessories

Bulletin 100-C/104-C IEC Contactors

- Compact sizes from 4…45 kW/5…60 Hp (9…85 A)
- AC and DC coil control
- Common accessories for all contactor sizes
- Front and side mounting of auxiliary contacts
- Electronic and pneumatic timing modules
- Space-saving coil-mounted control modules
- Reversible coil terminations (line or load side)
- All devices can be attached to 35 mm DIN mounting Rail
- Environmentally friendly materials

The Bulletin 100-C/104-C contactor family, along with a wide range of common accessories and Bulletin 193 solid-state overload relays, provides the most compact and flexible starter component system available.

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

Coil Terminal Position

- All contactors are delivered with the coil terminals located on the **line side**.
- For **load side** coil terminations, insert a **"U"** prior to the coil voltage code. Ordering example: **Cat. No. 100-C09UD10**.

Cat. No. 100-C09⊗10 Line Side

Cat. No. 100-C09U⊗10 Load Side

Bulletin 100S/104S Safety Contactors

- Mechanically linked N.C. auxiliary contacts
- Front-mounted auxiliary contacts:
  Gold bifurcated
  Permanently fixed
  Protective cover to prevent manual operation
  Red contact housing foreasy identification
  Incorporates IEC 60947-5-1 "Mechanically Linked" symbol
- AC and DC operating coils
- SUVA Third-Party certification

Bulletin 100S-C/104S-C safety contactors provide mechanically linked positively guided contacts, required in feedback circuits of modern safety applications. The mechanically linked N.C. auxiliary contacts will not change state when a power pole welds. In addition, the gold-plated bifurcated auxiliary contacts are ideally suited for low-energy applications or feedback control circuits with multiple series-connected N.C. auxiliary contacts.

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

Bulletin 100Q-C Capacitor-Switching Contactors

- Compact sizes
- Limits high inrush currents
- AC and DC coil control
- Reversible coil terminals
- Panel or 35 mm DIN Rail mounting
- Environmentally friendly materials

The Bulletin 100Q-C Capacitor-Switching contactors are designed for switching banks of capacitors. The unique design uses front-mounted resistor elements that limit the severely high inrush currents seen in these applications. This reduces stress to the contactors and the capacitors, as well as allowing a more compact and economical design without the use of air-core reactors.

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories.

Wye-Delta/Star-Delta Starter Kits

Wye-Delta power wiring kits were designed to aid in the field assembly of open-transition wye-delta starters that use Bulletin 100-C contactors. These kits include line, load, and start-point (shorting) connections. Assembling a wye-delta starter requires the use of the following additional components:

- Contactors
- Overload Relay
- Cat. No. 100-MCA02 Mechanical/Electrical Interlock
- Cat. No. 100-ETY30 Electronic Y-Δ Timer
- Cat. No. 100-S9 Base Coupler for 1M to 2M contactor (optional)

∗ Must be ordered in multiples of the package quantity.
❄ 16 mm² max. according to IEC 60947; actual max. 25 mm².

Bulletin 100-D IEC Contactors

- 50…500 kW @ 400V
- 60…600 Hp @ 460V
- 75…700 Hp @ 575V
- Electronic and conventional coils
  AC & DC
  Integrated PLC interface
  Low power pick-up & hold-in
  Wide voltage ranges
- Complete range of accessories
- Environmentally friendly
- Compact dimensions

The Bulletin 100-D/104-D contactor family, along with a wide range of common accessories and Bulletin 193 electronic overload relays, provides the most compact and flexible starter component system available.

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

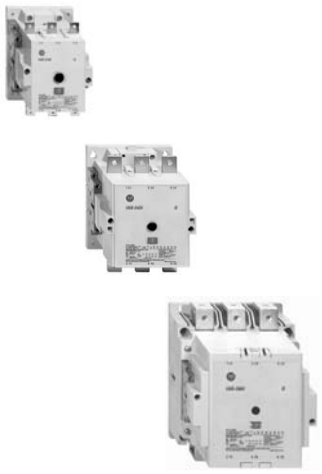
4	4	100-DS2-11	100-DS1-11	100-D…22L	100-DS1-L11∗	100-DS2-11
Sequence starts with…		7/8	3/4		1/2	5/6

∗ With conventional DC control, the pickup winding must be interconnected with the N.C. late-breaking auxiliary contacts.



Bulletin 100S-D Safety Contactors

- 50…500 kW @400V
- 60…600 Hp @460V
- 75…700 Hp @575V
- Electronic and conventional coils
  - AC & DC
  - Integrated PLC interface
  - Low power pick-up & hold-in
  - Wide voltage ranges
- Complete range of accessories
- Environmentally friendly
- Compact dimensions

Bulletin 100S-D safety contactors were designed to address the needs of modern safety applications requiring feedback and monitoring of the energy isolating switchgear used in hazardous motion loads. The 100S-D meets these needs through its "mirror contact" design. If a power contact welds, the N.C. auxiliary contacts will not change state. This feature provides reliable indication about the open/closed status of the main power poles. In addition, the gold-plated bifurcated auxiliary contacts are ideally suited for low-energy applications or feedback control circuits with multiple series-connected N.C. auxiliary contacts.

Your order must include: cat. no. of the contactor specified with coil voltage code and, if required, cat. no. of any accessories and/or replacement coils.

Bulletin 100-G IEC Contactors

- 315...710 kW, 400V
- 350…900 Hp, 460/575V
- 3-Pole contactors
- 4th add-on neutral switching pole
- AC and DC control
- Horizontal and vertical interlocking
- Mechanical latching
- Meets IEC, CE, and cULus Standards and Certifications

The Bulletin 100-G contactor product family provides reliable switching of motor loads up to 1200 A. A complete range of accessories including auxiliary contacts, mechanical latches, horizontal and vertical interlocks, and 4th add-on neutral switching poles provides maximum flexibility to meet a wide variety of application requirements.

Your order must include: cat. no. of the contactor selected, coil voltage code, overload relay suffix code, and, if required, cat. no. of any accessories.

❄ No UL/cUL
‡ Preferred value according to IEC 60072-1.

⊗ Coil Voltage Code

The Cat. No. as listed is incomplete. Select a coil voltage code from the table below to complete the Cat. No. Example: 120V, 50/60Hz: **Cat. No. 100-G550⊗22** becomes **Cat. No.100-G550KD22**.

For Use With:	[V]	100…110	110…120	200…220	220…240	345…380	380…415	400…440	440…480
100-G550...100-G860	50/60 Hz	—	KD	—	KF	—	KN	—	KB
	DC	KD	—	KF	—	KN	—	KB	—

For Use With:	[V]	110…115	110	220…230	220	240	380…400	440	480V
100-G1000...100-G1200	50/60 Hz	KD	—	KF	—	KA	KN	KB	KU
	DC	—	ZD	—	ZA	—	—	—	—

Price Adder For	Type	Available Control Voltages	No Surcharge
Special control voltages	100-G550…100-G860	24…600V 50/60 Hz, 24…440V DC	>25 pieces
	100-G1000…100-G1200	48…600V 50/60 Hz, 48…440V DC	

Control Modules

	Description		For Use With	Cat. No.
4-Pole	**Auxiliary Contact Block** For mounting between T1 & T2 or between T2 & T3 Adjustable; provides normal, delayed, or overlapping contacts Max. 2 blocks/contactor Alternate terminal marking tags included 2 N.O. and 2 N.C. contacts	 ***Standard Terminal marking for mounting between T1 & T2***  ***Alternate terminal marking for mounting between T2 & T3***	100-G550…100-G860	**100-EF22**
2-Pole	**Auxiliary Contact Block** For side mounting on either side of the contactor Max. 4 blocks/contactor Alternate terminal marking tags included 1 N.O. and 1 N.C. contact	***Standard terminal marking*** ***Alternate terminal markings***	100-G1000…100-G1200	**100-EB11**

* Electronic coil drives are designed to minimize power requirements, but this control may exhibit a higher inrush (540 W, < 10 ms) when energizing. This must be taken into account for the proper sizing of supply devices, all-or-nothing relays and cross-sections of coil supply lines. Please contact your local Rockwell Automation sales office or Allen-Bradley distributor for detailed information.

Electrical Life in Utilization Category

Bulletin 100-C/104-C IEC contactors are designed for superior performance in a wide variety of applications. When selecting IEC products, the user must give consideration to the specific load, utilization category and required electrical life of the application. The life-load curves shown here are based on Rockwell Automation tests according to the requirements defined in IEC 60947-4-1. Since contact life in application is dependent on environmental conditions and duty cycle, actual application contact life may vary from that indicated by the curves shown here.

To find the contactor's estimated electrical life, follow these guidelines:

1. Identify the appropriate utilization category from the table below.
2. Choose the graph for the utilization category selected.
3. Locate the intersection of the life-load curve for the appropriate contactor with the application's operational current (I_e) found on the horizontal axis.
4. Read the estimated contact life along the vertical axis.

2

Contact Life for Mixed Utilization Categories AC-3 and AC-4:

In many applications, the utilization category cannot be defined as either purely AC-3 or AC-4. In those applications, the electrical life of the contactor can be estimated from the following equation:

Lmixed = Lac3/[1 + Pac4*(Lac3/Lac4 – 1)], where:

Lmixed Approximate contact life in operations for a mixed AC-3/AC-4 utilization category application.

Lac3 Approximate contact life in operations for a pure AC-3 utilization category (from the AC-3 life-load curves).

Lac4 Approximate contact life in operations for a pure AC-4 utilization category (from the AC-4 life-load curves).

Pac4 Percentage of AC-4 operations.

Test Conditions			Making			Breaking		
			I/I_e	U/U_e	cosϕ	I_c/I_e	U_r/U_e	cosϕ
AC-1	**Resistance Furnaces:** Non inductive or slightly inductive loads		1	1	0.95	1	1	0.95
AC-2	**Slip-ring motors:** Starting and reversing		2.5	1	0.65	2.5	1	0.65
AC-3	**Squirrel - cage motors:** Starting and stopping of running motors	I_e < 17 A I_e > 17 A	6 6	1 1	0.65 0.35	1 1	0.17 0.17	0.65 0.35
AC-4	**Squirrel - cage motors:** Starting, plugging✶, inching❄	I_e < 17 A I_e > 17 A	6 6	1 1	0.65 0.35	6 6	1 1	0.65 0.35
AC-15	**Soleniods:** Contactors, valves and lifting magnets		10	1	0.7	1	1	0.4

I_e Rated operational current — I Making Current
U_e Rated voltage — Ic Breaking Current
U_r Recovery voltage — U Off-load voltage

✶ Plugging is understood as stopping or reversing the motor rapidly by reversing motor primary connections while the motor is running.

❄ Inching (jogging) is understood as energizing a motor once or repeatedly for short periods to obtain small movements of the driven mechanism.

E1 Plus Solid-State Overload Relays

Overview

E1 Plus Solid-State Overload Relays

- Self-powered
- Phase loss protection
- Wide adjustment range (5:1)
- Over-molded power connections
- 1 N.O. and 1 N.C. isolated auxiliary contacts (B600 Rated)
- Low energy consumption (150 mW)
- Ambient temperature compensation
- Visible trip indication

193-ED version offers:

- 0.1…27 A current range
- Fixed Trip Class 10
- Manual reset

193-EE version offers:

- 0.1…800 A current range
- Selectable Trip Class (10, 15, 20, or 30)
- Selectable manual/auto-manual reset
- Single- and three-phase devices
- Optional cage clamp control terminals (Bul. 193R-EE only)

Table of Contents

- C-Tick
- CCC

Your order must include 1) the Cat. No. of overload relay selected, and 2) if required, Cat. No. of any accessories.

Product Overview

Accurate, Reliable Performance

Current measurement-based protection

While electromechanical overload relays pass motor current through heating elements to provide an indirect simulation of motor heating, the E1 Plus Overload Relay directly measures motor current. Current measurement-based overload protection more accurately models a motor's thermal condition. Furthermore, ambient temperature does not impact the performance of current measurement-based designs over the specified temperature operating range.

Electronic design

Thermal modeling is performed electronically with precision solid-state components, where at the heart of the E1 Plus Overload Relay is an application-specific integrated circuit (ASIC). The ASIC continually processes motor current data to accurately maintain the time-current status of the motor thermal capacity utilization value.

Thermal memory

A thermal memory circuit allows the E1 Plus Overload Relay to model the heating and cooling effects of motor on and off periods. This ensures accurate protection for both hot and cold motors.

Enhanced phase loss protection

A separate phase loss detection circuit incorporated into the E1 Plus Overload Relay allows it to respond quickly to phase loss conditions; typical reaction time is 3 seconds.

Easy to Select and Apply

Straightforward installation

The self-powered design means that the E1 Plus Overload Relay installs in the same manner as traditional overload relays. Device setup is accomplished by simply dialing the setting potentiometer to the motor FLA rating. The low energy consumption of the electronic design minimizes temperature rise issues inside control cabinets.

Wide adjustment range

A wide 5:1 adjustment range results in the need for half as many catalog numbers as the bimetallic alternative in order to cover the same current range. This helps to reduce inventory carrying costs and affords greater installation flexibility for dual voltage machines. Evenly spaced setting tick marks enhance the ease of installation setup.

Rugged Construction

Over-molded power connections

The unique line-side over-molded power connections make for a sturdy two-component starter assembly that is unmatched in the industry. The pre-formed power connections allow easy starter assembly — every time.

Current transformers

The current transformers are secured separately in the overload housing to ensure the greatest degree of resistance to shock and vibration conditions. Varnished laminations ensure consistent performance and provide additional protection against corrosion.

Latching relay

The robust design of the bi-polar latching relay provides reliable trip and reset performance for the most demanding of applications. The self-enclosed relay offers additional environmental protection for use in industrial applications.

Application Flexibility

Isolated Contacts

The isolated contact configuration allows the N.C. and N.O. contacts to be applied in circuits operating at different voltage levels and without polarity restrictions. The B600 contact rating affords application in circuits rated to 600V.

DIP switch settings

193-EE devices offer DIP switch settings to select the trip class (10, 15, 20 or 30) and the reset mode (manual or automatic), making these devices extremely versatile.

Side-Mount Expansion Modules

Through the use of optional side-mounted accessory modules, functionality of the E1 Plus overload relays can be cost effectively expanded and machine operation and protection enhanced. Direct mounting to the left side of the 193-EE and 592-EE E1 Plus overload relays means that only 18 mm is added to the overall product width. The side-mounted modules electronically interface with the E1 Plus overload relay so that all control circuit connections are made at the E1 Plus overload relay terminals.

E1 Plus DeviceNet™ Communication Module

The Bul. 193-EDN DeviceNet Communication Side-Mount Module provides a cost-effective, seamless deployment of motor starters onto the Integrated Architecture™ as an accessory for the E1 Plus electronic overload relay. The DeviceNet module provides Integrated I/O (2 inputs and 1 output) providing local connection of motor starter-related I/O. The DeviceNet module offers expanded protective functions including overload warning, jam protection, and underload warning. The DeviceNet module also allows access to average motor current (percentage of FLA setting), percentage of thermal capacity usage, device status, trip & warning identification, and trip history which allows continual monitoring of motor performance.

E1 Plus Remote Reset Module

The Bul. 193-ERR Remote Reset Module is available for applications that require remote reset of the E1 Plus overload relays after a trip occurs.

E1 Plus Jam Protection Module with Remote Reset

The Bul. 193-EJM Jam Protection Module provides front-accessible DIP switches which offers flexibility to provide jam protection to match application requirements. Selections are available for enabling or disabling the jam protection function and remote reset operation. Jam trip level settings are available at 150%, 200%, 300%, and 400% of full load current setting. Trip delay settings of 1/2, 1, 2, and 4 seconds are available to minimize nuisance tripping in applications where intermittent short-duration overloading is permissible.

E1 Plus Ground Fault Module with Remote Reset

The Bul. 193-EGF Ground Fault Protection Module offers front-accessible DIP switches providing flexibility to configure ground fault protection to match application requirements. Selections are available for enabling or disabling the ground fault protection function and remote reset operation. Ground fault trip level settings are available in four ranges: 20…100 mA (resistive loads only, for motor loads consult your local Allen-Bradley distributor), 100…500 mA, 0.2…1 A, and 1…5 A. Within each range, the specific ground fault trip level can be set (20%, 35%, 50%, 65%, 80%, 90%, or 100% of the maximum ground fault setting). Trip delay is fixed at 50 ms ± 20 ms.

E1 Plus Ground Fault/Jam Module with Remote Reset

The Bul. 193-EGJ Ground Fault/Jam Protection Module offers front-accessible DIP switches to provide flexibility to configure ground fault and jam protection to match application requirements. The ground fault selections are the same as the Bul. 193-EGF Ground Fault Protection Module. In addition to ground fault, this module offers selectable fixed jam protection. The user can enable or disable jam protection from the DIP switches. The jam protection is fixed at 400% of the full load current setting with a 0.5 second trip delay.

E1 Plus PTC Module with Remote Reset

The Bul. 193-EPT PTC Side-Mount Module provides two terminals for the connection of positive temperature coefficient (PTC) thermistor sensors. PTC sensors are commonly embedded in the motor stator windings to monitor winding temperature. PTC sensors react to actual temperature, so enhanced motor protection can be provided to address conditions like obstructed cooling and high ambient temperature.

General

	Cat. No. 193-ED1_B, 193-EE_B	Cat. No. 193-EE_D	Cat. No. 193-EE_E
Standards	UL508, CSA C22.2 No. 14, NEMA ICS 2-1993 Part 4, EN 60947-4-1, EN 60947-5-1		
Certifications	CE, cULus, ATEX (pending), C-Tick, CCC		
Approximate Weights (unpackaged)	0.25 kg (0.55 lb)	0.25 kg (0.55 lb.)	0.52 kg (1.06 lb.)

External Current Transformers (for use with cat. nos. 193-EE_Z)

The user shall provide one current transformer (CT) for each motor phase,and shall connect the CT's secondary leads to the appropriate E1 Plus overload relay power terminals, as shown in current transformer's wiring diagrams. The CT shall have the appropriate ratio (refer to the product nameplate or product description). Additionally, the CT shall be selected to be capable of providing the required VA to the secondary load, which includes the E1 Plus overload relay burden at the rated secondary current and the wiring burden. Finally, the CT shall be rated for protective relaying to accomodate the high inrush currents associated with motor startup, and shall have an accuracy of <±2% over its normal operating range. Typical CT ratings include (Instrument Transformers, Inc. — Model #23 or equivalent):

ANSI (USA)	**Class C5B0.1**
CSA (Canada)	**Class 10L5**
IEC (Europe)	**5 VA Class 5P10**

Wiring Schematic

Bulletin 193-EC — E3 & E3 Plus Solid-State Overload Relays

Bul. 193/592-EC1 Overload Relays:
- 0.4…5000 A current range
- DeviceNet ready (ODVA Conformance Tested)
- LED indicators
- Test/Reset button
- Adjustable trip class 5…30
- Ambient temperature compensation
- True RMS current sensing (20…250 Hz)
- Protection for single- and three-phase motors
- Integrated I/O (2 In/1 Out)
- Programmable trip and warning settings
- Diagnostic functions (history of last 5 trips and warnings)
- Node address switches (series B)

Bul. 193/592-EC2/EC3 Overload Relays:
- Features of Bul. 193/592-EC1
- Integrated I/O (4 In/2 Out)
- EC2: Low-level (1…5 A) internal ground fault protection
- EC3:High-level (20 mA…5 A) external ground fault protection
- PTC thermistor monitoring
- DeviceLogix™ component technology (series B)
- Two-speed motor protection (series B)

Bul. 193/592-EC4 Current Monitor Relay:
- Current monitoring for three independent channels

Product Overview

The E3 Overload Relay is available in two configurations: the E3 and E3 Plus. The following table illustrates the functional differences between the two:

Feature	E3	E3 Plus
Inputs*	2	4
Outputs	1	2
Thermistor Input	No	Yes
Ground Fault Protection	No	Yes
DeviceLogix	No	Yes

* Inputs are rated 24V DC.

Thermal Overload

Thermal Utilization

The E3 Overload Relay provides overload protection through true RMS current measurement of the individual phase currents of the connected motor. Based on this information, a thermal model that simulates the actual heating of the motor is calculated. Percent of thermal capacity utilization (%TCU) reports this calculated value and can be read via the DeviceNet network. An overload trip occurs when the value reaches 100%.

Adjustable Settings

Thermal overload protection setup is accomplished simply by programming the motor's full load current rating (FLA) and the desired trip class (5…30). Programming of the actual values through software programming ensures the accuracy of the protection.

Thermal Memory

The E3 Overload Relay includes a thermal memory circuit designed to approximate the thermal decay for a trip class 30 setting. This means that the thermal model of the connected motor is maintained at all times, even if the supply power is removed.

Reset Modes

Flexibility is afforded the end-user in the ability to select between manual and automatic reset for an overload trip, allowing for broad application. The point of reset is user adjustable from 1…100% TCU.

Time to Trip

During an overload condition, the E3 Overload Relay provides an estimated time to trip that is accessible via the DeviceNet network. This allows corrective action to be taken so that production may continue uninterrupted.

Time to Reset

Following an overload trip, the E3 Overload Relay will not reset until the calculated percentage of thermal capacity utilization falls below the reset level. As this value decays, the time to reset, which is accessible via the DeviceNet network, is reported.

Thermal Warning

The E3 Overload Relay provides the capability to alert in the event of an impending overload trip. A thermal warning bit is set in the Warning Status word when the calculated percentage of thermal capacity utilization exceeds the programmed thermal warning level, which has a setting range of 0…100% TCU.

Two-Speed Protection

The E3 Plus Overload Relay offers a second FLA setting for 2-speed motor protection. What used to require two separate overload relays, one for each set of motor windings, can now be accomplished with one device. Improved protection is delivered as thermal utilization is maintained in one device during operation in both speeds.

Phase Loss

The E3 Overload Relay offers configurable phase loss protection in allowing the installer to enable or disable the function plus set a time delay setting, adjustable from 0.1…25.0 seconds. The trip level is factory-set at a current imbalance measurement of 100%.

Ground (Earth) Fault

The E3 Plus Overload Relay incorporates zero sequence (core balance) sensing into its design through the 90 A rating for low level (arcing) ground fault detection. Trip and warning settings are adjustable from 20 mA…5.0 A. For devices rated greater than 90 A and for ground fault detection less than 1.0 A, the external core balance current transformer accessory is required. Class I protection is provided as defined by UL1053. Series B or later devices provide a trip inhibit setting, offering flexibility to prevent tripping when the ground fault current magnitude exceeds 10 A. This can be useful to guard against opening of the controller when the fault current could potentially exceed the controller's interrupting capacity rating. **Note:** The E3 Plus Overload Relay is not a Ground Fault Circuit-Interrupter for personnel protection as defined in article 100 of the U.S. National Electric Code.

Stall
Stall is defined as a condition where the motor is not able to reach full-speed operation in the appropriate amount of time required by the application. This can result in motor overheating as current draw is in excess of the motor's full load current rating.
The E3 Overload Relay provides user-adjustable stall protection. The trip setting has a range of 100…600% FLA, and the enable time is adjustable up to 250 seconds.

Jam (Overcurrent)
The E3 Overload Relay can respond quickly to take a motor off-line in the event of a mechanical jam, thereby reducing the potential for damage to the motor and the power transmission components. Trip adjustments include a trip setting adjustable from 50…600% FLA and a trip delay time with a range of 0.1…25.0 seconds. A separate warning setting is adjustable from 50…600% FLA.

Underload (Undercurrent)
A sudden drop in motor current can signal conditions such as
- Pump cavitation
- Tool breakage
- Belt breakage

For these instances, rapid fault detection can help minimize damage and aid in reducing production downtime.

Additionally, monitoring for an underload event can provide enhanced protection for motors that are coded by the medium handled (e.g., submersible pumps that pump water). Such motors can become overheated despite being underloaded. This can result from an absence or an insufficient amount of the medium (due to clogged filters, closed valves, etc.).

The E3 Overload Relay offers underload trip and warning settings adjustable from 10…100% FLA. The trip function also includes a trip delay time with a range of 0.1…25.0 seconds.

Over-temperature Protection
The E3 Plus Overload Relay provides motor over-temperature protection with the added provisions for terminating and monitoring of stator windingembedded positive temperature coefficient (PTC) thermistors. PTC thermistors are semiconductors that exhibit a large increase in resistance when the rated response temperature is exceeded. When the monitored PTC thermistor resistance exceeds the response level of the E3 Plus Overload Relay (3400 Ω), it can be set to trip immediately or programmed to set the PTC bit of the Warning Status word.

Current Imbalance (Asymmetry)
The E3 Plus Overload Relay offers current imbalance trip and warning settings adjustable from 10…100%. The trip function also includes a trip delay time with a range of 0.1…25.0 seconds.

Remote Trip
The remote trip function allows an external device such as a vibration sensor to induce the E3 Overload Relay to trip. External device relay contacts are wired to the E3 Overload Relay discrete iputs. The discrete inputs are configurable with an option for assigning the remote trip function.

Current Monitoring Functions
The E3 Overload Relay allows the user to monitor the following operational data over the DeviceNet network:
- Individual phase currents (in amperes)
- Individual phase currents (as a percentage of motor full load current)
- Average current (in amperes)
- Average current (as a percentage of motor full load current)
- Percentage of thermal capacity utilized
- Current imbalance percentage
- Ground fault current (E3 Plus)

Diagnostic Functions
The E3 Overload Relay allows the user to monitor the following diagnostic information over the DeviceNet network:
- Device status
- Trip status
- Warning status
- Time to an overload trip
- Time to reset after an overload trip
- History of past five trips
- History of positive warnings
- Hours of operation
- Number of starts

Status Indicators
The E3 Overload Relay provides the following LED indicators:

Network Status: This green/red LED indicates the status of the network connection.

TRIP/WARN: This LED flashes an amber code under a warning condition and a red code when tripped.

OUT A and B: These amber LEDs illuminate when the output contacts are commanded closed.

IN 1– 4: These amber LEDs illuminate when the user-connected device contact is closed.

Note: IN 3 and 4 and OUT B are available only on the E3 Plus Overload Relay.

Inputs/Outputs
Inputs allow the connection of such devices as contactor and disconnect auxiliary contacts, pilot devices, limit switches and float switches. Input status can be monitored via the network and mapped to a controller's input image table. Inputs are rated 24V DC and are current sinking. Power for the inputs is sourced from the DeviceNet network connection with convenient customer terminations at control terminals 5 and 6. Relay contact outputs can be controlled via the network or DeviceLogix function blocks for performing such tasks as contactor operation.

Test/Reset Button
The Test/Reset button located on the front of the E3 Overload Relay allows the user to perform the following:
Test: The trip relay contact will open if the E3 Overload Relay is in an untripped condition and the Test/Reset button is pressed for 2 seconds or longer.
Reset: The trip relay contact will close if the E3 Overload Relay is in a tripped condition, supply voltage is present, and the Test/Reset button is pressed.

Single/Three-Phase Operation
The E3 Overload Relay can be applied to three-phase as well as single-phase applications. A programming parameter is provided for selection between single- and three-phase operation. Straight-through wiring is afforded in both cases.

DeviceNet Communications
The E3 Overload Relay is a Group 2 "slave only" device and supports the following:
- UCMM (Unconnected Message Manager) messages
- Polled I/O messaging
- Change-of-state/cyclic messaging
- Explicit messaging
- Group 4 - Off-line node recovery messaging
- Full parameter object support
- Auto-baud network rate identification
- Configuration consistency value

For more information on operation and maintenance of this product, please reference the user manual, publication 193-UM002_-EN-P.

DeviceLogix

The E3 Plus offers increased control flexibility with DeviceLogix capabilities. Using RSNetWorx for DeviceNet (version 3.0 or later), function block programs can be configured and saved to an E3 Plus Overload Relay to operate single logic routines. The function blocks are programmed using standard Boolean operators such as AND, OR, XOR, and NOT, plus timers, counters, and latches. In addition to allowing the use of the integral discrete inputs, protection functions can also be used as inputs to trigger outputs. For example, the Ground Fault Protection function could be used to control Output A of the E3 Plus Overload Relay for operation of a circuit breaker short-trip mechanism.

DeviceNet™ Configuration Terminal

The DeviceNet Configuration Terminal (**Cat. No. 193-DNCT**) is a handheld device that can be used to commission, configure, program, and monitor devices on your DeviceNet network. The 193-DNCT allows you to increase productivity and ease troubleshooting with easy access to information and diagnostics of your system.

Network Who

The 193-DNCT can be used with any DeviceNet device and has DeviceLogix, metering, graphing, and auto-display capabilities which can help ease troubleshooting by commissioning devices online through your network. The terminal searches for all devices on the network and provides device address, device name, and status of a device.

Monitoring & Editing

The DeviceNet Configuration Terminal can be used to upload, store, and download device configurations and DeviceLogix™ programs for DeviceNet devices via your network. Easily replace and reconfigure scan lists of DeviceNet scanners (minus the Automatic Device Replacement configuration). Parameters can be accessed as either groups or as a numbered list of all parameters, and they can be monitored and edited.

Diagnostics

Ease troubleshooting using the DeviceNet Configuration Terminal. The 193-DNCT can present DeviceNet diagnostics, network utilization, and network statistics are available including baud rate, bus voltage, percentage of bus loading, and CAN errors.

DeviceLogix

The terminal allows you to enable, monitor, edit, or delete DeviceLogix programs.

AC Input Interface Module Accessory

The AC Input Interface Module conveniently allows the E3 overload relay to be retrofitted or applied in new applications that require 110/120V AC control circuitry. This new accessory simply plugs into the E3 overload relay's existing input terminals, optimizing panel space utilization. The module accepts termination of up to four external devices, making it compatible with the E3 and E3 Plus versions of the E3 overload relay. Optical isolation is provided between the AC input wiring and the E3's internal 24V circuitry.

Current Reporting Accuracy

Phase Currents: 100% min. FLA Setting Value … 720% max. FLA Setting Value 50%…100% min FLA Setting Value	 +/- 5% +/- 10%
Ground Current (0.5…9.0 A)	+/- 10%

External Current Transformers (for use with Cat. Nos. 193-EC1ZZ1, 193-EC3ZZ, and 193-EC4ZZ)

The user shall provide one current transformer (CT) for each motor phase,and shall connect the CT's secondary leads to the appropriate E3 overload relay power terminals, as shown in current transformer's wiring diagrams. The CT shall have the appropriate ratio (refer to the product nameplate or product description). Additionally, the CT shall be selected to be capable of providing the required VA to the secondary load, which includes the E3 overload relay burden of 0.1 VA at the rated secondary current and the wiring burden. Finally, the CT shall be rated for protective relaying to accomodate the high inrush currents associated with motor startup, and shall have an accuracy of <±2% over its normal operating range. Typical CT ratings include (Instrument Transformers, Inc. — Model #23 or equivalent):

ANSI (USA)	**Class C5B0.1**
CSA (Canada)	**Class 10L5**
IEC (Europe)	**5 VA Class 5P10**

Bulletin 193-EF

193-E1

- 0.5…400 A current range
- Phase loss/current imbalance protection
- LED indicators
- Digital (DIP switch) adjustments
- Adjustable Trip Class (2…30)

193-EF2 also includes:

- 0.5…630 A current range
- Overcurrent indication
- PTC thermistor monitoring

Bulletin 193-EF overload relays offer precise and reliable ambient compensated overload protection for the protection of three-phase squirrel cage motors. DIP switch settings allow the Bulletin 193-EF overload relays to be closely matched to the motor characteristics to safely obtain full utilization of the motor. The wide adjustment range of the trip class setting allows the Bulletin 193-EF overload relays to be applied in a wide variety of applications. The 193-EF2 version offers enhanced motor protection with additional circuitry for monitoring motor winding embedded thermistors.

Mounting Materials — Bus Bars

Set of 3 busbars, includes terminal and fixing screws. Suitable for use with Cat. No. 193-EF1A and 193-EF2A overload relays.

	Description	Pkg. Qty.	Cat. No.
	M8 connections Set of 3 4 x 16 x 102 mm (1/8 x 5/8 x 4-1/64 in.) (125 A max.) Universally applicable Weight: 230 g	3	**825-MVM**
	M8 connections Set of 3 4 x 20 x 117 mm (1/8 x 25/32 x 4-39/64 in.) (180 A max.) Universally applicable	3	**825-MVM2**
	M6 lower connections Set of 3 For mounting on Bul. 100-D95 and 100-D110 contactors with conventional coil	3	**825-MVS**
	M8 lower connections Set of 3 For mounting on Bul. 100-D140, 100-D180 conventional and Bul. 100-D95E…100-D180E contactors with electronic coil	3	**825-MVS2**

Labeling Materials

Uniform labeling materials for contactors, motor starting equipment, timing relays and circuit breakers

	Description	Pkg. Qty.❄	Cat. No.
	Label Sheet 105 self-adhesive paper labels each, 6 x 17 mm	10	**100-FMS**
	Marking Tag Sheet 160 perforated paper labels each, 6 x 17 mm To be used with a transparent cover	10	**100-FMP**
	Transparent Cover To be used with marking tag sheets	100	**100-FMC**
	Marking Tag Adapters To be used with marking tag:	100	100-FMA2

❄ Must be ordered in multiples of package quantities.

2

Supply Voltage Failure
In the event of a supply voltage failure, the output relay resets and the stand-by indicator goes out. The actual status is stored for 30 minutes. When the supply voltage is restored, the output relay reverts to its original state.

Reset — Manual
The reset button resets all protection functions. Resetting from any location is possible with the 193-RB1 remote reset module.

Reset — Automatic
Automatic resetting of thermal overload and thermistor overtemperature functions is an optional feature. All other protection functions must be reset manually.

Test Button for Thermal Overload Protection
Pressing the test button will verify thermal tripping operation time at $6x/_e$ without the motor being connected. The test button must be held for longer than the set trip time $t_{6x/e}$.

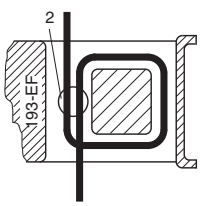
Device Installation and Commissioning
The operating instructions enclosed with the device provide all of the information necessary to set and commission it.

Surface Mounting
193-EF_A Snap-on fixing to standard DIN Rail or screw fixing
193-EF_B Screw fixing
193-EF_C Screw fixing
Mounting position: optional

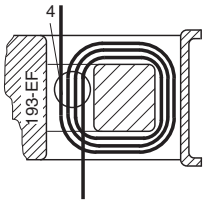
Setting the Rated Current (0.5…20 A) (193-EF1A and 193-EF2A Requires 193-HD)

The motor supply cables are looped through the current transformer twice, thereby doubling the rated motor current. The setting on the Bulletin 193-EF overload relay is the product of:

I_e [A] x…number of loops



Motor supply wire looped twice



Motor supply wire looped 4 times

Recommended for I_e [A]	Motor Supply Cables	Cable Cross Section (Flexible Strand)	
		IEC [mm²]	CSA, UL (AWG No.)
20…180	fed straight through	4…95	10…10 000
10…20	looped twice	2.5…25	14…10
5…10	looped 4 times	1…6	14
2.5…5	looped 8 times	0.75…2.5	14
0.5…2.5	looped 40 times	0.5…0.75	❄

❄ CSA, UL: for I_e = 0.5…2.5 A, only factory-assembled wound devices should be installed

Bulletin 193-T1 — Bimetallic Overload Relays

- Overload protection Trip Class 10A
- Phase loss protection
- Ambient temperature compensation
- Auxiliary contact (1 N.O. and 1 N.C.)
- Manual/automatic reset
- Optional remote reset solenoid and external reset
- Stop button
- Test release
- Trip Indicator

Bulletin 193-T1 thermal overload relays are designed for use with Bulletin 100-C contactors and Bulletin 104-C reversing contactors. These class 10A ambient-compensated thermal overload relays include a differential mechanism for sensitivity to phase loss conditions. The trip setting is adjustable over the listed motor full load current range. The overload relay can be operated in a manual or automatic reset mode.

∗Bulletin 193-T1 overload relays should not be used with conventional DC contactors. Use electronic DC versions.
❄ To select the setting range for use in Y-Δ Starters, multiply the rated operating current of the motor by a factor of 0.58.
‡ For motors with service factor of 1.15 or greater, use motor nameplate full load current. For motors with service factor of 1.0, use 90% of the motor nameplate full load current.
§ Max. Back-up fuse [A], UL Class K5, 10 kA, 600V AC

Type of Overload Relay			Bimetallic, Ambient Compensated, Phase Loss Sensitive
Trip Rating (ultimate tripping current)			120% FLA
Phase loss sensitivity: Trip rating at phase loss			115% FLA
Trip Class		IEC/EN 60947-4-1	10A
		UL	10
Reset Mode			Automatic or Manual
Test release			Manual release of auxiliary contacts
Trip indication			By means of a flag visible through an opening in the relay front
Compensation temperature range			-20…+60 °C (-4…+140 °F)
Climatic Conditions	Release Tolerance at -20 °C		1.05…1.4 x I_n
	Storage Temperature Range		-55…+80 °C (-67…+176 °F)
	Operating Temperature Range		-20…+60 °C (-4…+140 °F)
	Air moisture (Storage/Operating)		5…95% rel.humidity, non-condensing
Vibration	(per IEC/EN 60068-2-6), service		3g
	IEC/EN 61373 (vibration railways)		category 1, class B
	IEC/EN 60092-504 (vibration ships), service		0.7 g, all axes, 2…200 Hz
Shock	(per IEC/EN 68000-2-27), transport		30 g
	IEC/EN 60068-2-27 (Shock half-sinus), service		11 ms > 5 g all axes
	IEC/EN 61373 (shock railways)		category 1, class B, 5g 30 ms
Max. Altitude			2000 m
Pollution Degree			3
Degree of Protection, with wires connected			IP2X
Materials			RoHS compliant
Flame resistivity (Outer housing parts)		UL-94	V0
Approximate Weight (unpackaged)	193-T1A, 193-T1B	0.16…25 A	0.115 kg
	193-T1B	30…38 A	0.155 kg
	193-T1C	25…47 A	0.330 kg
	193-T1D	47…90 A	0.360 kg
	193-T1….P	47…90 A	0.415 kg

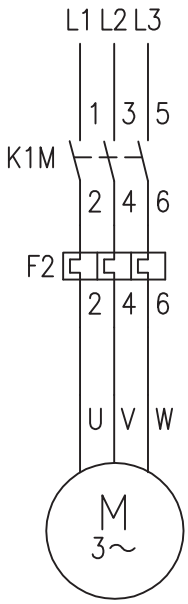
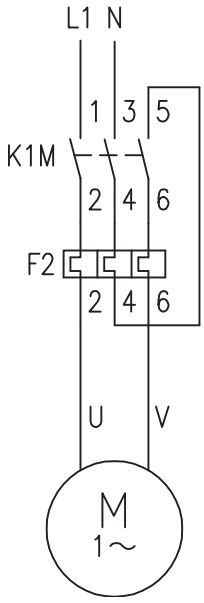
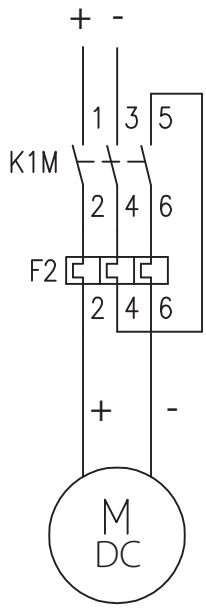
Circuit Diagrams



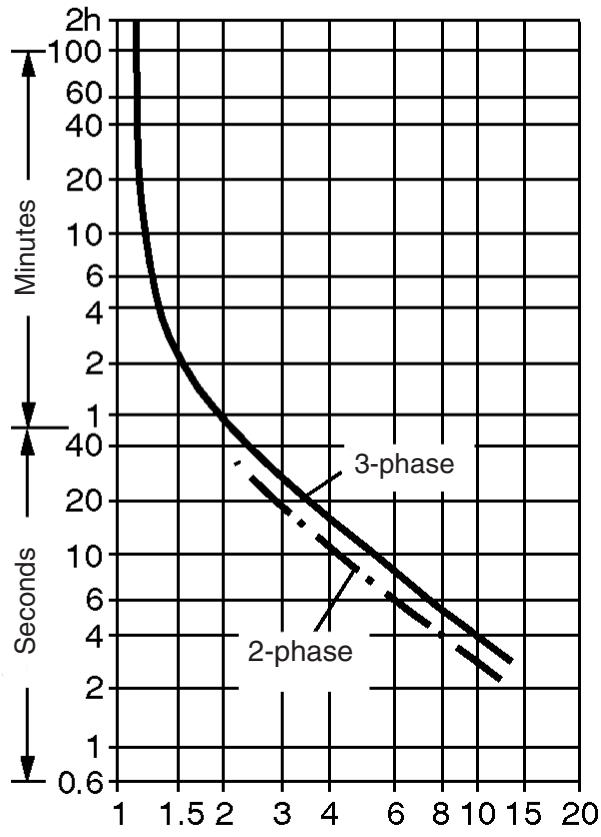




Trip Characteristics

These trip characteristics refer to IEC/EN 60947-4-1 and are average values from cold start at an ambient temperature of 20 °C. Trip time is pictured as a function of operating current. With the device at max. operating temperature, the trip time decreases to approximately 25% of the shown value.

Trip Class 10A



Bulletin 193-K — Miniature Bimetallic Overload Relays

- Standard motor protection for AC and DC motors
- Overload protection Trip Class 10A
- Auxiliary switch (1 N.O. and 1 N.C.)
- Phase loss sensitivity
- Manual/Auto reset button
- Test release
- Stop button
- Trip indicator

Bulletin 193-K bimetallic overload relays are designed for use with Bulletin 100-K contactors and Bulletin 104-K Reversing Contactors. These class 10A ambient temperature-compensated thermal overload relays include a differential mechanism for sensitivity to phase-loss conditions.

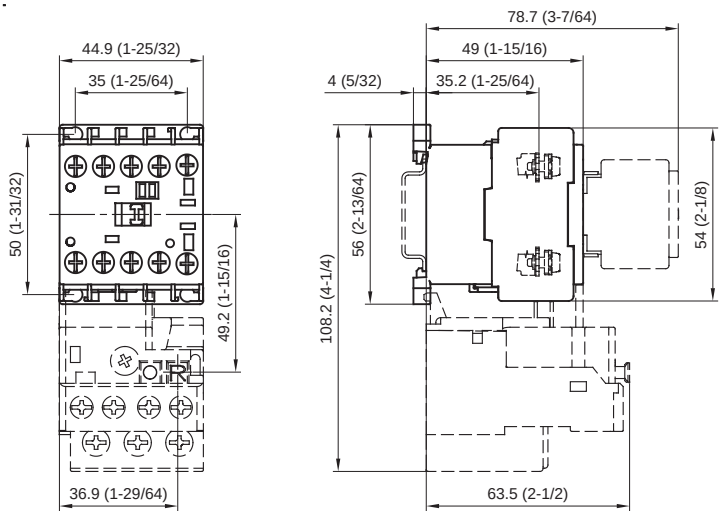
Dimensions are shown in millimeters (inches). Dimensions are not intended for manufacturing purposes.



Bulletin 825-P

- 0.5…5000 A current range
- Suitable for low- and medium-voltage applications
- Modular design with pluggable options
  - Voltage input card
  - Expansion I/O cards
  - Communications cards, including DeviceNet
  - RTD scanner module
- Comprehensive protection functions
- Built-in keypad and backlit 2-line LCD
- Test/Reset button
- Status LEDs
- Front accessible RS232 port
- 3 output relays
- 2 configurable inputs
- NEMA 12 (IP65) compatible

Description

The Bulletin 825-P Modular Protection System for motors offers a compact, modular design that uniquely allows an installer to configure a device's functional capabilities to match the application requirements. Flexibility is also afforded by accommodating future expansion of the system as the application requirements grow. Finally, ease of installation is provided through pluggable options and accessories.

Comprehensive Protection

The 825-P Modular Protection System offers in-depth motor protection coverage by monitoring the critical elements of motor current, line voltage and temperature. High resolution settings allow the installer to configure a precise envelope of protection to achieve maximum motor utilization while avoiding damage and downtime.

Ground Fault Current	Voltage Imbalance	—	—	—
System Frequency	System Frequency	—	—	—

Note: Voltage and power elements are only available with the installation of the voltage input option card.

Statistical Values

The 825-P Modular Protection System provides the following valuable statistical values of motor operation:

- Elapsed time of operation
- Stopped time
- Percent of time running
- Number of starts
- Number of emergency starts
- Date and time of last trip reset

Historical Data

The 825-P Modular Protection System saves records for the five most recent trip events. Each trip event is summarized with record of the following prior to trip data capture:

- Event day and time
- Trip identification
- Phase and ground current values
- Voltage values

Bulletin 141A MCS Mounting System

- Modularity makes planning easy
- Factory-assembled starters
- Easy starter exchange
- Flexible field assembly of starters
  - DOL starters
  - Reversing starters
  - Star-Delta starters
  - Soft starters
  - Inverter
  - Complete range of accessories
- 3 mounting methods
  - On busbars
  - On 35 mm and 75 mm top hat rails
  - Screw fixing

ISO Busbar Modules

- 2-part construction
  - Device Adapter Plate (or DAP) (carrying the starter) snaps onto the base of the module
  - Base module remains on busbar when exchanging starters, providing isolation from live parts
- Test position with load circuit isolated
- Designed for use with control plug (order separately)
- Modules with current ratings supply the load current by means of wire connections matched to Bulletin 140-M motor protection circuit breakers
- Modules can form bigger platforms using the connection clips (see accessories)
- For plugging on 5 mm or 10 mm thick busbars
- Meets feeder circuit spacings per UL 508A

Standard Busbar Modules

- Modules plug directly onto the busbar
- Suitable for use with control plug
- Modules with current ratings supply the load current by means of wire or terminal connections
- Modules can form bigger platforms using the connection clips (see accessories)
- For plugging on 5 mm or 10 mm thick busbars
- Meets feeder circuit spacings per UL 508

	Busbar Fuse Switch 3-pole switch disconnector with fuses	For fuse links D02, for D01 fuses use reducer	400V AC	63 A∗	1	141A-NF0102
		For 10 x 38 NFC cylindrical fuses	690V AC	32 A	1	141A-NF1038
	Pilot Switch Pilot switch for signaling ON/OFF position of lid For 140-NF0102, 140-NF1038 and 140-NFH1038 250V AC/5 A; 30V DC/4 A				1	141A-NFASNF
	Spacer Module Connectable on both sides 9 mm wide				5	141A-NFAD
	Reducer D02 reducer for D01 fuses For 141A-NF0102				20	141A-NFAR
	Class J Busbar Fuse Base For mounting on 10 mm wide and double-T busbars Top or bottom connection For UL Class J fuses			61…100 A	1	**141A-NFJ100**
				101…200 A	1	**141A-NFJ200**
				201…400 A	1	**141A-NFJ400**

∗ The use of spacer module 141A-NFAD is recommended for a continuous load above 35 A.

Busbar Components, Continued

	Description				PQ	Cat. No.
	NH Fuse Switch Disconnector Connection bottom or top Size 00 for plugging on 5, 10 mm thick and double-T busbars. Sizes 1 and 2 conversion kit 141A-NFAFR5 is required for plugging on 5 mm thick busbars. Size 3 only for plugging on 10 mm and double-T busbars.	Size 00 200 x 106 mm	M8 70 mm²	160 A	1	**141A-NFD160**
		Size 1 243 x 184 mm	M10 120 mm²	250 A	1	141A-NFD250
		Size 2 288 x 210 mm	M10 240 mm²	400 A	1	141A-NFD400
		Size 3 300 x 256 mm	M12 240 mm²	630 A	1	141A-NFD630
	Pilot Switch For NH-fuse switch disconnectors Signaling ON/OFF position of lid 250V AC/5 A 30V DC/4 A	Size 00…3			1	141A-NFASNFD
	Wedge Clamp Terminal For NH-fuse switch disconnectors Connection accessories	Size 1 18 x 10 mm	70…150 mm²		1	141A-NFVF1150
		Size 2 21 x 15 mm	120…240 mm²		1	141A-NFVF2240
		Size 3 25 x 20 mm	150…300 mm²		1	141A-NFVF3300
	Conversion Kit For NH-fuse switch disconnector to reduce size 1 and 2 on to 5 mm busbars	Size 1 and 2			1	141A-NFAFR5
	Cover for Cable Lugs For NH fuse switch disconnecor Can be clipped on bottom or top	Size 00			1	**141A-NFAC00A**
		Size 1			2	**141A-NFAC1A**
		Size 2			2	**141A-NFAC2A**
		Size 3			2	**141A-NFAC3A**

Accessories

	Description	Width [mm]	Pkg. Qty.	Cat. No.
	Hat (DIN) Rails — MCS Top Hat Rail (Plastic) Slides onto mounting modules and is then fixed with screws. Has notches for MCS components (prevents movement of components when used with vertical busbar)	45	10	**141A-AHR45**
		54		**141A-AHR54**
		63		141A-AHR63
	Hat (DIN) Rails — Standard Top Hat Rail (Plastic) Slides onto mounting modules and is then fixed with screws	72	10	**141A-AHS72**
		81		141A-AHS81
	**Control Plug** Pull-apart terminal block allows fast and simple disconnection of control wiring Snaps on the support of the mobile device rail Composed of plug holder, male and female parts	8 Pole	1	**141A-APC8**
		10 Pole	1	**141A-APC10**
		12 Pole	1	**141A-APC12**
	Control Plug Holder Suitable for use with 8-, 10-, or 12-pole control plugs			**141A-APH**
 Cat. No. 141A-AS9S	**Spacer module — for ISO busbar modules** For 9 mm spacing of mounting modules. Connection clips (Cat. No. 141A-AK) are included for attaching the spacer module to the mounting modules.	200	10	**141A-AS9S**
 Cat. No. 141A-AS9B	**Spacer module — for Standard busbar modules** For 9 mm spacing of mounting modules. Connection clips (Cat. No. 141A-AK) are included for attaching the spacer module to the mounting modules.	200		**141A-AS9B**
	Spacer Module — for Mounting modules For spacing of load feeders by 9 mm e.g. for improved cooling. Including connection clips.	228		**141A-AS9W**
	Connection Clip For joining base of mounting modules		50	**141A-AK**
	Micro Switch N.C. Contact Only for ISO Modules. Automatically drops out the contactor when the DAP (Device Adapter Plate) (carrying the starter) is unplugged from the base of the ISO busbar module.		10	141A-AS

Busbars (required quality)

Material		E-CU blank or tinned
Busbar widths 5 or 10 mm thick	[mm]	12, 15, 20, 25, 30
Tolerance of thickness	[mm]	+0.1/-0.3
Corner radius	[mm]	0.5
Tolerance of center spacing	[mm]	60 +0.5/-0.5
Standard		DIN 46433

General Data

Main Circuits

Rated insulation voltage U_i		
Acc. to IEC, EN	[V]	690
Acc. to UL, NEMA, CSA, EEMAC	[V]	600
Rated impulse withstand voltage U_{imp}	[kV]	8
Rated frequency	[Hz]	50…60
Pollution degree		3
Ambient temperature		
Operation	[°C]	-25…+60
Transport and storage	[°C]	-50…+80

Protection class - Modules and busbars	IP00
- Modules and busbars mounted on plate, connected conductors and usage of busbar covers	IP20
- Iso-Modules with device adapter plate removed, from front	IP20 B (finger proof)
Standards and Norms	IEC/EN 60439-1
Certifications	CE, cULus Recognized

Control Circuits

Control plugs		
Rated insulation voltage U_i		
Acc. to IEC, EN	[V]	250
Acc. to UL, NEMA, CSA, EEMAC	[V]	300
Rated impulse withstand voltage U_{imp}	[kV]	4
Rated current at 40 °C ambient temperature I_{th}	[A]	12

Micro switch		
Rated insulation voltage U_i		
Acc. to IEC, EN	[V]	250
Acc. to UL, NEMA, CSA, EEMAC	[V]	300
Rated current		Suitable for switching contactors 100-C AC-coil-voltage ≤ 250 V DC-coil-voltage ≤ 120 V

Coordination Ratings for Bulletin 103S and 103T Starters

Bulletin 103S starters consist of a Bulletin 140M Motor Protection Circuit Breaker (MPCB) and a Bulletin 100C Contactor. These starters are referred to as 2-Component Starters.

Bulletin 103T starters consist of a Bulletin 140M Motor Circuit Protector (MCP), a Bulletin 100C Contactor and a Bulletin 193 Overload Relay.
These staters are referred to as 3-Component Starters.

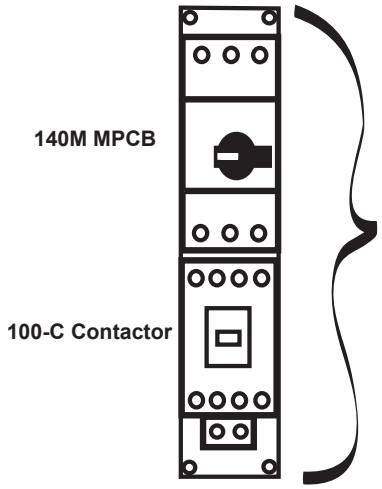
All of these combination starters may provide the branch-circuit, short-circuit protection, overload protection and magnetic control for each individual motor circuit. Additional short-circuit protection is not required for the protection of the individual motor circuits. Additionally, these starters are available with Type 1 or Type 2 coordination, as Type F Combination Motor Controllers (CMCs), or as Type E Self-Protected Combination Motor Controllers.These different coordination levels between the Bulletin 140M circuit breakers and the Bulletin 100C contactors are illustrated
below, along with the IEC and UL/CSA approvals for each type of starter.

IEC Type 1 coordination
* The contactor or starter may be inoperative and require replacement in the event of a short-circuit.

IEC Type 2 coordination
* No damage to the overload relay or other parts may occur in the event of a short-circuit, except welding of the contactor is permitted, as long as the contacts can be easily separated without significant deformation (such as with a screwdriver).

UL Type F Combination Motor Controller
* No damage to the motor protection circuit breaker is allowed in the event of a short-circuit. The contactor may be inoperative and require replacement.

UL Type E Self-Protected Combination Motor Controller
* No damage to the contactor, overload relay, or other parts may occur in the event of a short-circuit.



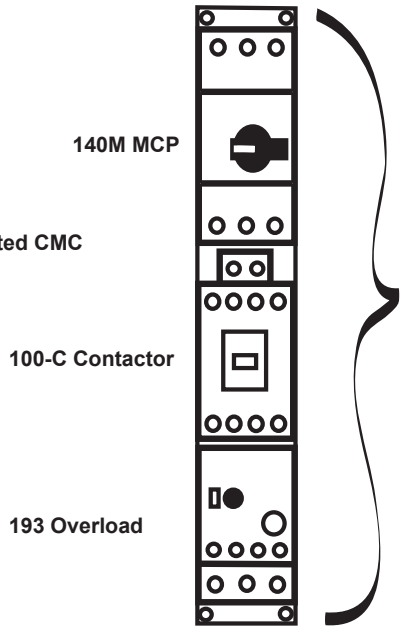
103S Starter
UL/CSA Approvals
* **Type F CMC**
* **Type E Self-Protected CMC**

IEC Approvals
* **Type 1**
* **Type 2**

Bulletin 103S

The 140M MPCBs (C..F frames) are UL/CSA listed as Type E Manual, Self-Protected Combination Motor Controllers. This allows for the Bulletin 103S starters to be UL/CSA listed as Combination Motor Controllers (Type F). Some of the Bulletin 103S starters are also available with Type 2 coordination between the 140M and the 100C.

Additionally, some of the Bulletin 103S starters have also been UL/CSA listed as Type E Self-Protected Combination Motor Controllers, providing an additional level of coordination between the 140M and the 100-C.



103T Starter
UL/CSA Approvals
* **Type E Self-Protected CMC**

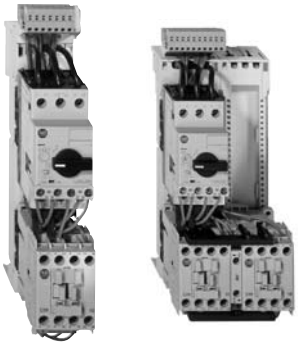
IEC Approvals
* **Type 1**
* **Type 2**

Bulletin 103T

The 140M MCPs (C..F frames) are UL/CSA listed as Manual Motor Controllers. This allows for the Bulletin 103T starters to be UL/CSA listed only as Type E Self-Protected Combination Motor Controllers.

This listing then allows for the Bulletin 103T starters to provide the short-circuit protection, overload protection and magnetic control for individual motor circuits and insures a high level of coordination between the 140M and the 100C.

2



Bulletin 103S/107S IEC Starters

- Non-reversing (Bul. 103S) and reversing (Bul. 107S) starters
- Current range 0.1…90 A
- cULus Listed Type F Combination Motor Controllers
  - Type 1 Coordination
  - Type 2 Coordination
- cULus Listed Type E Self-Protected Combination Motor Controllers
- Assemblies consist of Bulletin 140M MPCBs and Bulletin 100-C contactors mounted on Bulletin 141A busbar or panel mounting modules
- Installation and wiring of Control Plug for auxiliary contacts is standard on ISO Busbar Mount starters.
- Factory installed options include:
  - Installation of Lockable Twist Knob.
  - Installation of Spacing Adapter for Type E or Type F Starters.
  - Electronic Interface and Surge Suppressors for coil on 100-C.
  - Additional auxiliary contacts for 100-C.
  - Additional auxiliary or trip contacts on 140M.

Bulletin 107S Standard Busbar Mount starter with front-mount auxiliary contacts and control plug, as factory-installed options.

Group Motor, Type E, and Type F Combination Motor Controllers (UL/CSA)

The Bulletin 103S/107S motor controllers can be used in a variety of applications. These starters can be used in group motor applications, or as a stand-alone product without any additional short-circuit protection in the motor branch circuits.

Most of the Bul. 140M-C/D motor protection circuit breakers used in the Bul. 103S/107S starters are cULus Listed as a manual **Type E** self-protected combination motor controller. Although there are many tests involved, one of the critical tests a self-protected combination motor controller must pass is to perform 6000 electrical operations and an additional 4000 mechanical operations after a short circuit.

By definition, a **Type F** combination motor controller consists of a Type E manual self-protected combination motor controller and a magnetic or solid-state motor controller (such as a Bul. 100-C contactor or an SMC). As with a manual Type E self-protected combination motor controller, additional short-circuit protection for the individual motor circuits is not required.

A combination of a Bul. 140M manual self-protected combination motor controller and a 100-C contactor can be listed as a Type E self-protected combination motor controller. In this case, the 140M and 100-C must pass the additional 6000 electrical and 4000 mechanical operations test. In some cases, this may require oversizing of either component to achieve weld-free performance and meet the additional life requirements.

Multiple Motor Installation with 103S Combination Starters

Bulletin103S Combination Starters provide Individual Branch Circuit Protection for each motor.
They consist of a 140M Motor Protection Circuit Breaker and a 100C Contactor.
These combination starters may provide the branch-circuit, short-circuit protection, overload protection and magnetic control for each individual motor circuit. Additional short-circuit protection is not required for the protection of the individual motor circuits, leaving only the requirement for protection of the Feeder-Circuit conductors by an upstream protective device.
Below is an example that illustrates installations involving multiple motors using Bulletin 103S Combination Starters.

Bulletin 103S Combination Starters are UL/CSA listed as Type F Combination Motor Controllers or as Type E Self-Protected Combination Motor Controllers. These starters may provide the branch-circuit protection for each individual motor circuit.

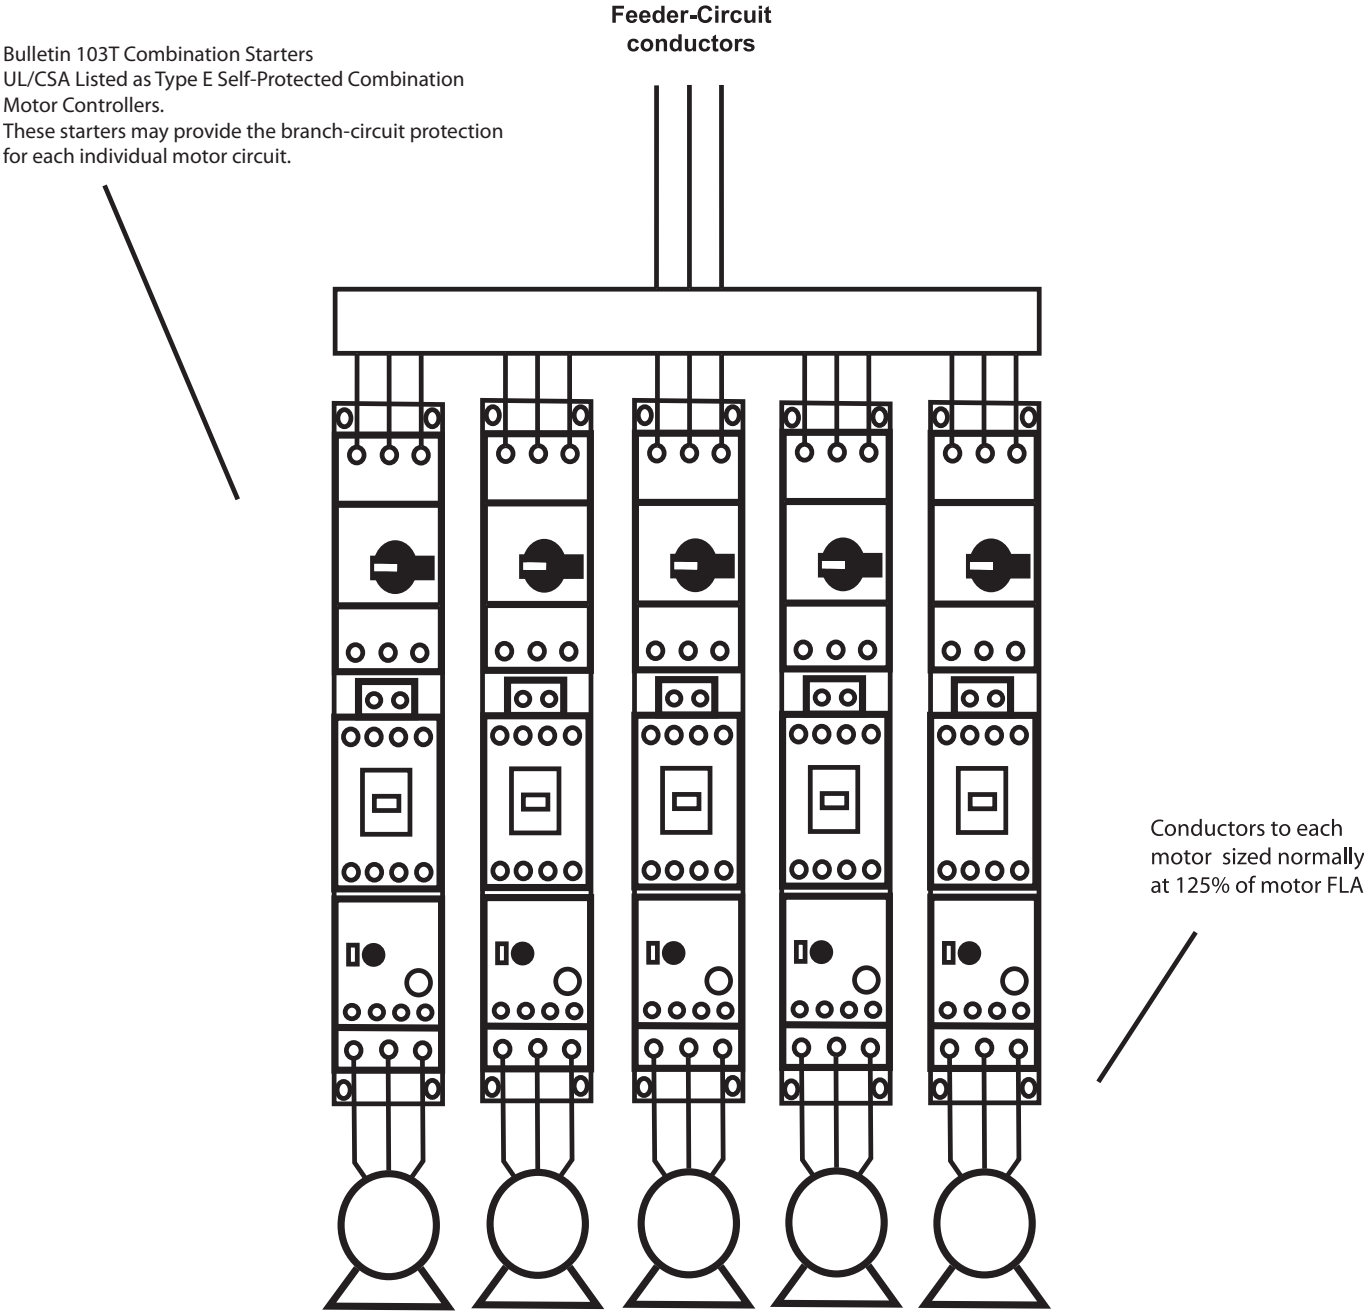
Multiple Motor Installation with 103T Combination Starters

Each Motor has an Individual Branch Circuit Protective Device (BCPD)

Bulletin103T starters provide Individual Branch Circuit Protection for each motor.
They consist of a 140M Motor Circuit Protector, a 100C Contactor and a 193 Overload Relay.
These combination starters may provide the branch-circuit, short-circuit protection, overload protection and magnetic control for each individual motor circuit. Additional short-circuit protection is not required for the protection of the individual motor circuits, leaving only the requirement for protection of the Feeder-Circuit conductors by an upstream protective device.
Below is an example that illustrates installations involving multiple motors using Bulletin 103T Combination Starters.



Group Motor and Type E Combination Motor Controllers (UL/CSA)

The Bulletin 103T/107T motor controllers can be used in a variety of applications. These starters can be used in a group motor application or as a stand-alone product without any additional short-circuit protection in the motor branch circuits.

Most of the 140M-C/D motor protection circuit breakers used in the 103T/107T starters are UL listed as a manual motor controller with instantaneous trip short-circuit protection and is rated for group motor applications. Since there is no overload protection provded by these MCPs, a separate overload relay must be added to the motor branch circuit.

A combination of a 140M motor circuit protector, 100-C contactor and 193-E overload relay can be listed as a Type E self-protected combination motor controller. In this case, the 140M, 100-C and 193-E must pass an additional 6000 electrical and 4000 mechanical operational test after a short-circuit. In some cases, this may require over sizing of the 140M motor circuit protector or the 100-C contactor to achieve weld free performance and meet the additional life requirements.

Bulletin 103T/107T starters utilizing the 140F fuse holders must be used with a separate disconnecting means, as these fuse holders are not rated as a disconnect switch.

Product Selection and Coordination Ratings with Bulletin 193-EC, -ED, or EE Overload Relays—UL/CSA in Group Motor Installations

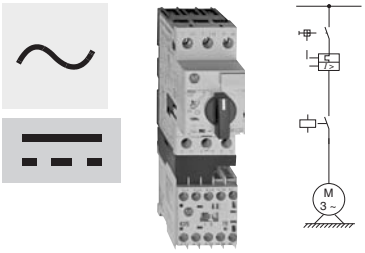
Bulletin 190E Direct On-Line Eco Starters

Note: Verify that the motor protection circuit breaker can be set to the rated motor current!

- 190E/191E Modular Eco Starter using Bulletin 140M Motor Protection Circuit Breaker and Bulletin 100-K/104-K Mini Contactors and Bulletin 100-C/104-C MCS Contactors
- Mounting Options:
  Snap Fixing on (1) 35 mm top hat rail



Group Motor, Type E and Type F Combination Motor Controllers (UL/CSA)

The 190E/191E motor controllers can be used in a variety of applications. These starters can be used in a group motor application or as a stand-alone product without any additional short-circuit protection in the motor branch circuits.

Most of the 140M-C/D motor protection circuit breakers used in the 190E/191E starters are UL Listed as a manual Type E self-protected combination motor controller. Although there are many tests involved, one of the critical tests a self-protected combination motor controller must pass is to perform 6000 electrical ops. and an additional 4000 mechanical ops. after a short circuit.

By definition, a Type F combination motor controller consists of a Type E manual self protected combination motor controller and a magnetic or solid-state motor controller (such as a 100-C contactor or an SMC). As with a manual Type E self-protected combination motor controller, additional short-circuit protection is not required for the individual motor circuits.

A combination of a 140M manual self protected combination motor controller and 100-C contactor can be listed as a Type E self-protected combination motor controller. In this case, the 140M and 100-C must pass the additional 6000 electrical and 4000 mechanical operational test. In some cases, this may require over sizing of the 140M motor protection circuit breaker or the 100-C contactor to achieve weld-free performance and meet the additional life requirements.

Product Selection and Coordination Ratings — UL/CSA in Group Motor Installations

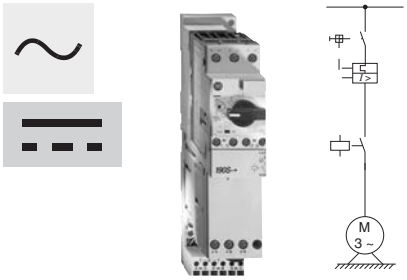
Bulletin 190S Direct On-Line Compact Starters

- 190S Compact Starter using Bulletin 140M Motor Protection Circuit Breaker and Bulletin 100-C Contactor
- Short-Circuit Coordination Type "1" and "2" according to IEC 60947-4-1
- Complete unit, ready for connection with internal wiring
- Accessories: Bulletin 140M Circuit Breakers and 100-C Contactors
- Removable cover
- IEC and cULus Certified
- Auxiliary Contacts Wired to Terminal Block at Bottom of Starter Assembly
- Mounting Versions:
  - Screw Fixing
  - Snap Fixing on (1) or (2) 35 mm top hat rails
  - Snap Fixing on (1) 75 mm top hat rail



Group Motor, Type E and Type F Combination Motor Controllers (UL/CSA)

The 190S/191S motor controllers can be used in a variety of applications. These starters can be used in a group motor application or as a stand alone product without any additional short-circuit protection in the motor branch circuits.

Most of the 140M-C/D motor protection circuit breakers used in the 190S/191S starters are UL Listed as a manual Type E self-protected combination motor controller. Although there are many tests involved, one of the critical tests a self-protected combination motor controller must pass, is to perform 6000 electrical ops. and an additional 4000 mechanical ops. after a short circuit.

By definition, a Type F combination motor controller consists of a Type E manual self protected combination motor controller and a magnetic or solid-state motor controller (such as a 100-C contactor or an SMC). As with a manual Type E self-protected combination motor controller, additional short-circuit protection is not required for the individual motor circuits.

A combination of a 140M manual self protected combination motor controller and 100-C contactor can be listed as a Type E self-protected combination motor controller. In this case, the 140M and 100-C must pass the additional 6000 electrical and 4000 mechanical operational test. In some cases, this may require over sizing of the 140M motor protection circuit breaker or the 100-C contactor to achieve weld-free performance and meet the additional life requirements.

Note: Verify that the motor protection circuit breaker can be set to the rated motor current.

Bulletin 103H starter in enclosure size A

Bulletin 107H starter in enclosure size C

Bulletin 103H/107H/140M Enclosed Combination Starters and Motor Protectors

Bulletin 103H/107H enclosed combination starters consist of a Bulletin 140M motor protection circuit breaker and a Bulletin 100C/104C contactor in a metallic Type 3/4/12 enclosure.

Bulletin 140M enclosed motor protection circuit breakers consist of a Bulletin 140M motor protection circuit breaker in a metallic Type 3/4/12 enclosure.

Features

- Current range 0.1…45 A
- cULus Listed for control and protection of motor loads
  - – Motor disconnect
  - – Short-circuit and overload protection
  - – Motor switching (magnetic)
- Factory-installed options include
  - – Pushbuttons, selector switches, and pilot lights
  - – Control transformer
  - – Auxiliary and trip indication contacts

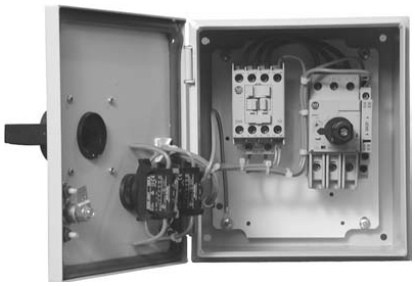
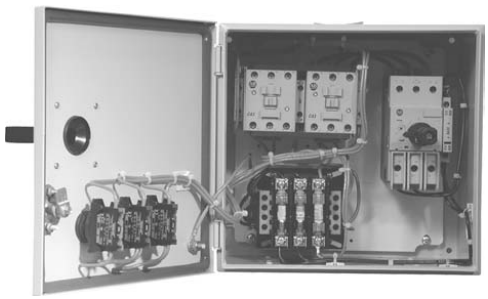
Product Selection

Reversing and Non-reversing Starters



The "A" size box accommodates:
-103H Non-Reversing Starters
-Motors up to 15 Hp/480V (23 A)
-2 pilot devices

The "B" size box accommodates:
-103H Non-Reversing Starters AND 107H Reversing Starters
-Motors up to 15 Hp/480V (23 A)
-Control Transformer and 3 pilot devices



The "C" size box accommodates:
103H Non-Reversing Starters AND 107H Reversing Starters
-Motors up to 30 Hp/480V (43 A)
-Control Transformer and 3 pilot devices

Type E and Type F Combination Motor Controllers (UL/CSA)

Most of the 140M-C/D motor protection circuit breakers used in the 103H/107H starters are UL Listed as a manual **Type E** self-protected combination motor controller. Although there are many tests involved, one of the critical tests a self-protected combination motor controller must pass is to perform 6000 electrical ops. and an additional 4000 mechanical ops. after a short circuit.

By definition, a **Type F** combination motor controller consists of a Type E manual self protected combination motor controller and a magnetic or solid-state motor controller (such as a 100-C contactor or an SMC). As with a manual Type E self-protected combination motor controller, additional short-circuit protection is not required for the individual motor circuits.

A combination of a Bulletin 140M manual self-protected combination motor controller and 100-C contactor can be listed as a **Type E** self-protected combination motor controller. In this case, the 140M and 100-C must pass the additional 6000 electrical and 4000 mechanical operational test. In some cases, this may require oversizing of the 140M motor protection circuit breaker or the 100-C contactor to achieve weld-free performance and meet the additional life requirements.

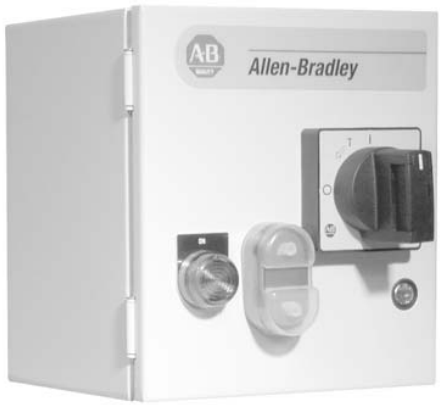
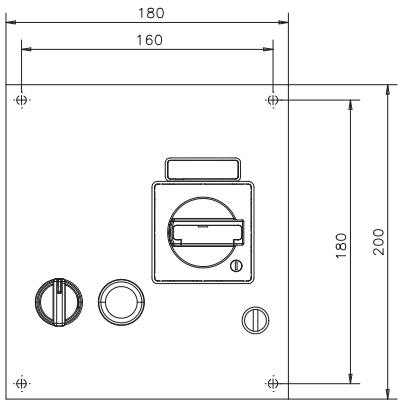
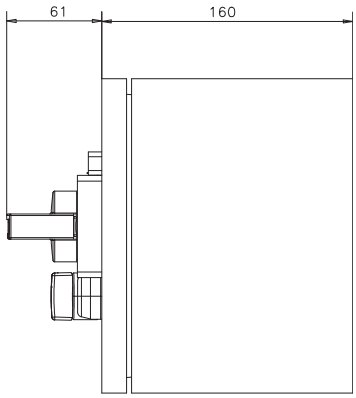
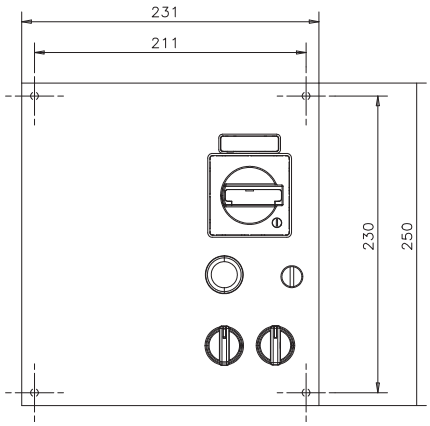
Enclosure Style A

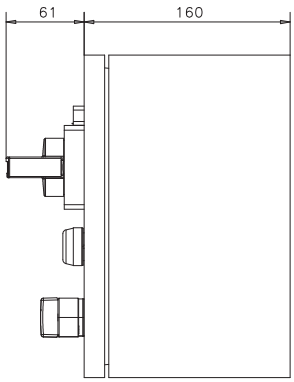




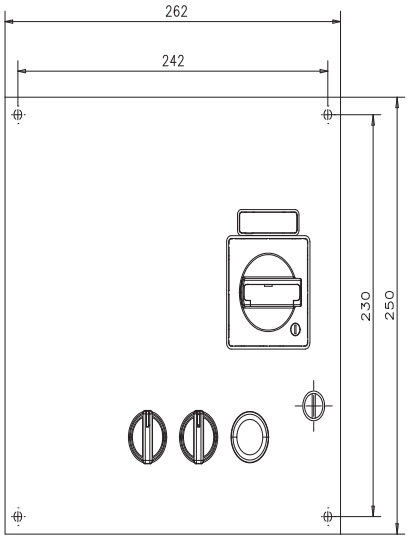


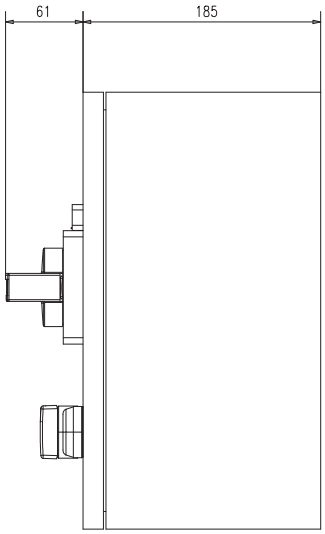
Enclosure Style B





Enclosure Style C





Cat. No. 105-C09ABA1F-1-6P Type 1 Metal Enclosure with Lift-off Cover

Bulletin 105 IEC Reversing Starters

- Selection of metal enclosures IP42 (Type 1) and IP66 (Type 3/4/12)
- Bimetallic Class 10 overload relays
- Solid-state overload relays
- Compact design
- Meets international standards

Bulletin 105 enclosed starters use Bulletin 104 reversing contactors and Bulletin 193 solid-state overload relays. These reversing starters (9…85 A) incorporate a "dual" interlock that provides both mechanical and electrical interlocking in a single unit. A normally open auxiliary contact is also included on each contactor.

✪ Overload Relay Code

The Cat. No. as listed is incomplete. Select an overload relay code from page 2-169 to complete the Cat. No.

✶ For single-phase (1Ø) applications, consult your local Rockwell Automation sales office or Allen-Bradley distributor.

❄ When selecting a factory-installed control circuit transformer (**see** Modifications page 2-348), use the Common Control Coil Voltage Code to denote the transformer primary voltage. The starter coil and transformer secondary voltage will both be 120V by default. Example: **Cat. No. 105-C09FB✪-6P** will have a transformer with a 480V primary/120V secondary and a 120V starter coil. If a starter coil voltage other than 120V is desired, a second Coil Voltage Code must be added to denote the coil/transformer secondary voltage. Example: **Cat. No. 105-C09FBJ✪-6P** will have a transformer with a 480V primary/24V secondary and a 24V starter coil.

Cat. No. 106-C30FBA1H-4RW-6P
IP66 (Type 3,4,12)
Metal Enclosure with Hinged Cover

Bulletin 106 IEC Reversing Combination Starters

- Selection of metal enclosures IP42 (Type 1) and IP66 (Type 3/4/12)
- Bimetallic Class 10 overload relay
- Solid-state overload relays
- Compact design
- Meets international standards
- Can be modified in the field
- Handle with defeater mechanism
- Padlockable handle (up to three padlocks)

Bulletin 106 Combination starters use a Bulletin 104 reversing contactor, a Bulletin 193 bimetallic (Class 10) or solid-state overload relay, and a Bulletin 194R rotary disconnect switch. Reversing starters (9 A…72 A) incorporate a "dual" interlock that provides both mechanical and electrical interlocking in a single unit. A normally open auxiliary contact is also included on each contactor.

	60 Hz	J	X	—	D	—	—	—	—	T	—	—	—	—	—	—

✪ Overload Relay Code

The Cat. No. as listed is incomplete. Select an overload relay code from page 2-169 to complete the Cat. No. Select an overload relay code from E1 Plus Overload Relay for 3Ø Applications: Phase Loss Protection, Class 10 or 20 to complete the Cat. No. Bimetal overload relays are not available in molded plastic enclosed starters.

‡ When selecting a factory-installed control circuit transformer (see Modifications page 2-348), use the Common Control Coil Voltage Code to denote the transformer primary voltage. The starter coil and transformer secondary voltage will both be 120V by default. Example: **Cat. No. 109-C09FB✪-6P** will have a transformer with a 480V primary/120V secondary and a 120V starter coil. If a starter coil voltage other than 120V is desired, a second Coil Voltage Code must be added to denote the coil/transformer secondary voltage. Example: **Cat. No. 109-C09FBJ✪-6P** will have a transformer with a 480V primary/24V secondary and a 24V starter coil. Control Circuit transformers are not available in molded plastic enclosures

IEC Fused Combination Starters

Overview/Product Selection

Cat. No. 112-C09FBA1F-1-7 IP66 (Type 3,4,12) Metal Enclosure with Hinged Cover

Bulletin 112 IEC Combination Starters

- Compact design
- Can be modified in the field
- Selection of enclosures
  - IP42 (Type 1)
  - IP66 (Type 3/4/12)
- Bimetallic Class 10 overload relays
- Solid-state overload relays
- Fusible or non-fusible versions
- Handle with defeater mechanism
- Padlockable handle with up to three padlocks

Bulletin 112 is the first true IEC combination starter on the market, in that the enclosure and components have been designed to specific IEC standard requirements. The Bulletin 112 combination starter consists of a Bulletin 100 Contactor, Bulletin 193 bimetallic (Class 10) or solid-state overload relay and Bulletin 194R fused disconnect switch installed in a common enclosure. These full-voltage combination starters are designed to provide the disconnecting means, short-circuit protection (with suitable fuses), control and overload protection for three-phase squirrel-cage motors. All starters include a normally open auxiliary contact as standard.

120V — Separate Control (without transformer) Coil Voltage Code		HD	AD	BD	CD

✪ Overload Relay Code

The Cat. No. as listed is incomplete. Select an overload relay code from page 2-169 to complete the Cat. No.

∗ For design "E" motor applications, consult your local Rockwell Automation sales office or Allen-Bradley distributor.

❄ When selecting a factory-installed control circuit transformer (see Modifications page 2-348), use the Common Control Coil Voltage Code to denote the transformer primary voltage. The starter coil and transformer secondary voltage will both be 120V by default. Example: **Cat. No. 113-C30FB3✪-6P** will have a transformer with a 480V primary/120V secondary and a 120V starter coil. If a starter coil voltage other than 120V is desired, a second Coil Voltage Code must be added to denote the coil/transformer secondary voltage. Example: **Cat. No. 113-C30FBJ✪-6P** will have a transformer with a 480V primary/24V secondary and a 24V starter coil.

Cat. No. 120E-C09FDA1FA1D-3-4RW-7
IP66 (Type 3,4,12)
Metal Enclosure with Hinged Cover

Bulletin 120E IEC Multi-Speed Starters

- Compact design
- Selection of enclosures
  IP42 (Type 1) and
  IP66 (Type 3/4/12)
- Bimetallic Class 10 overload relays
- Solid-state overload relays

Bulletin 120E multi-speed starters are designed to control "two-speed, separate-winding" AC squirrel-cage induction motors. These starters are available for constant torque, variable torque, or constant horsepower three-phase motors. Multi-speed motors are commonly used on machine tools, fans, blowers, pumps, conveyors and many other types of equipment.

Bulletin 120E multi-speed motor starters use Bulletin 100 contactors and Bulletin 193 bimetallic (Class 10) or solid-state overload relays. A normally open auxiliary contact is also included on each contactor. A wide variety of factory- and field-installed options are available.

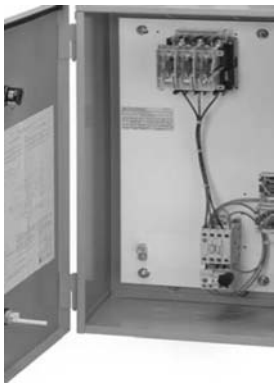
✪ Overload Relay Code

The Cat. No. as listed is incomplete. Select two overload relay codes from page 2-169 to complete the Cat. No. The first code will denote the high speed overload relay, and the second code will denote the low speed overload relay.

∗ For single-phase (1Ø) applications, consult your local Rockwell Automation sales office or Allen-Bradley distributor.

❄ When selecting a factory-installed control circuit transformer (see Modifications page 2-348), use the Common Control Coil Voltage Code to denote the transformer primary voltage. The starter coil and transformer secondary voltage will both be 120V by default. Example: **Cat. No. 120E-C09FB✪✪-6P** will have a transformer with a 480V primary/120V secondary and a 120V starter coil. If a starter coil voltage other than 120V is desired, a second Coil Voltage Code must be added to denote the coil/transformer secondary voltage. Example: **Cat. No. 12E-C09FBJ✪✪-6P** will have a transformer with a 480V primary/24V secondary and a 24V starter coil.



Cat. No. 132-C09MBA1F

Bulletins 132 and 133 IEC Pump Control Panel Starters

- IP32 (Type 3R)
- Bimetallic Class 10 overload relays
- Solid-state overload relays
- Enclosure with extra panel space for mounting accessory devices
- Factory-installed disconnect switch or circuit breaker
- Handle with defeater mechanism
- Service entrance rated

Bulletin 132 and 133 pump control panels are specifically designed for irrigation and similar outdoor pumping applications.
The Bulletin 132 pump control panel includes a Bulletin 194R IEC fusible rotary disconnect switch, a Bulletin 100 IEC contactor, a Bulletin 193 bimetallic overload relay or solid-state overload relays, a HAND-OFF-AUTO selector switch, and a START button. All starters include a normally open auxiliary contact as standard. The Bulletin 133 pump control panels are supplied with a motor circuit protector instead of a fusible disconnect switch. IEC pump control panels include an IP32 (Type 3R) weather-resistant enclosure with a rugged, outdoor finish and brackets for pole or cross-bar mounting. Conduit knockouts are located at the bottom of the enclosure. Padlock provisions are furnished on the door latches and the handle (both the ON and OFF positions).

⊗ Coil Voltage Code

The Cat. No. as listed is incomplete. Select a Coil Voltage Code from the table below to complete the Cat. No. Example: **Cat. No. 132-C12M⊗✪** becomes **Cat. No. 132-C12MB✪**

Voltage [V]		208	230…240	460…480	575…600
Common Control❄ Coil Voltage Suffix Code	60 Hz	H	A	B	C
120V Separate Control (without transformer) Coil Voltage Suffix Code		AD	AD	CD	CD

✪ Overload Relay Code

The Cat. No. as listed is incomplete. Select an overload relay code from page 2-169 to complete the Cat. No.

∗ For horsepower ratings less than those shown, consult your local Rockwell Automation sales office or Allen-Bradley distributor.

❄ When selecting a factory-installed control circuit transformer (see Modifications page 2-348), use the Common Control Coil Voltage Code to denote the transformer primary voltage. The starter coil and transformer secondary voltage will both be 120V by default. Example: **Cat. No. 132-C09MB✪-6P** will have a transformer with a 480V primary/120V secondary and a 120V starter coil. If a starter coil voltage other than 120V is desired, a second Coil Voltage Code must be added to denote the coil/transformer secondary voltage. Example: **Cat. No. 132-C09MBJ✪-6P** will have a transformer with a 480V primary/24V secondary and a 24V starter coil.

For Bulletins 105, 106, 109, 112, 113, 120E, 132, and 133

	Description		For Use With	Enclosure Type	Cat. No.

Modifications

Full Voltage Non-Reversing Starters and Lighting Contactors (Bulletins 109, 100L)

Listed on this and the following pages are factory-installed modifications and special features which are available for the low voltage (600V maximum) starters listed in this catalog. To order, add a dash followed by the suffix number listed in these tables to the end of the product Cat. No. Example: **Cat. No. 109-C09ADA1E-1**

Bulletin 194 Line Overview

	Bulletin 194E	**Bulletin 194L**	**Bulletin 194R Next Generation**
Product Type	Inductive load-rated load switch	Inductive load-rated control/load switch	Fused and non-fused rotary disconnects
Current Range	16…315 A	12…40 A	30 A, 60 A
Main Applications	• UL, CSA ratings "suitable as at-motor disconnect"	• UL, CSA ratings "suitable as at-motor disconnect"	• UL 98 ratings "suitable as service entrance disconnecting means" • UL 508, CSA ratings "suitable as at-motor disconnect"
Functionality	• 3- or 6-pole switch configurations for OFF-ON or changeover applications (16…100 A switches) • 3- or 4-pole switch configurations for OFF-ON or changeover applications (125…315 A switches)	• 1- to 6-pole multifunction switch control configurations for OFF-ON, changeover, Star-Delta (Wye-Delta), reversing, ammeter, voltmeter, and step switch applications • Also available in custom control configurations up to 16 circuits for any unique control switching application.	• 3- or 4-pole fusible or non-fusible disconenct for standard OFF-ON or emergency stop in a main panel disconnect application • 4th pole available as modular accessory • Test mode switch position
Mounting Styles	Front/door or base/DIN Rail mounting	Front/door or base/DIN Rail mounting	Base/DIN Rail mounting
Handles	• Handle colors in grey/black and red/yellow and padlockable versions • Legend plates available in 0-I international markings and text styles	• Uniformly styled handles: selector knob, disk style, rectangular style, and key-operated versions (Type 1/12/3R, IP66) • Handle colors in grey/black and red/yellow and padlockable versions • Legend plates available in 0-I international markings and text styles	• Available in rotary styles, UL Type 1/3R/4/4X/12, IP66, standard, or test mode versions • Handle colors in black and red/yellow and padlockable versions • 30 A/60 A legend markers (optional) — uses Cat. No. 1492-MS6X12 markers
Open Switch or Enclosed	• Open switch (large frame Bul. 194E — open style only) • Enclosed: IP66 thermoplastic enclosure or UL/CSA rated enclosure	• Open switch	• Open switch • Enclosed: UL/CSA rated enclosure
UL/CSA Electrical Ratings: Rated Voltage U_e	600V AC	600V AC	600V AC
Rated Current I_e	16…315 A @ 600V	12…40 A @ 600V	30 A, 60 A @ 600V
Rated Power P_e [FLA]	Varies w/ 1- or 3-phase switch, voltage	Varies w/ 1- or 3-phase switch, voltage	Varies w/ 1- or 3-phase switch, voltage
Short-Circuit Ratings	5 kA	5 kA	200 kA
Switching Rate [ops/h]	120	120	180
Mechanical Life [ops]	• 0.2 million (16…100 A switches) • 0.1 million (125 A and 160 A switches) • 0.075 million (250 A and 315 A switches)	• 1 million	• 10 000
IEC Rated Current I_e AC-1	16…315 A @ 600V	12…40 A @ 600V	20…63 A @ 690V
AC-21A	16…315 A @ 600V	12…40 A @ 600V	Varies w/ 1- or 3-phase switch, voltage
AC-22A	16…315 A @ 600V	12…40 A @ 600V	Varies w/ 1- or 3-phase switch, voltage
Ambient Operational Temp.	-25…+60 °C (-13…+140 °F)	-25…+60 °C (-13…+140 °F)	-20…+60 °C (-4…+140 °F)
Ambient Enclosed Temp.	-20…+60 °C (-4…+140 °F)	-20…+60 °C (-4…+140 °F)	-20…+60 °C (-4…+140 °F)
Ambient Storage Temp.	-40…+80 °C (-40…+176 °F)	-40…+80 °C (-40…+176 °F)	-40…+65 °C (-40…+149 °F)
Protection class per IEC 529	• Switch bodies: IP2	• Switch bodies: IP2	• Switch bodies: IP2 • Fuse carriers: IP30
Optional Accessories	• IP66 handles • Multi-length shafts and shaft extension kits • Terminal covers	• IP66 handles • Multi-length shafts and shaft extension kits • Terminal covers	• IP66 handles • Multi-length shafts • Auxiliary contacts • Terminal covers • NFPA 79 internal handle
Standards/Certifications	• UL 508 • CSA C22.2, No. 14 • IEC 60947-3 Low Voltage Switchgear and Controlgear part 3 • CE	• UL 508 • CSA C22.2, No. 14 • IEC 60947-3 Low Voltage Switchgear and Controlgear part 3 • CE	• UL 98, UL 508 • CSA C22.2, No. 14 • IEC 60947-3 Low Voltage Switchgear and Controlgear part 3 • CE

Bulletin 194E IEC Load Switches

- Suitable as At-Motor Disconnect Switch (UL508)
- 16, 25, 32, 40, 63, 80, 100 A Inductive Load-Rated Switches
- IP66/ UL Type 1/3/3R/12 Operating Handles
- IP2LX Finger-Safe Terminals
- 3- and 6-Pole Versions; Add-on Accessory Poles to Make 4-, 5-, 7- and 8-Pole Units
- Front/Door or DIN/Base Mounting Configurations
- Available in OFF-ON and Changeover Configurations
- 3- and 6-Pole Enclosed Switches
- Optional Thermoplastic Enclosures
- Positive-Guided Actuation
- Padlockable Handles Available (up to 3 padlocks)

Description

Bulletin 194E load switches are designed for use as local motor isolation and disconnect switch applications. Available with 3- and 6-pole versions with add-on additional poles, grounding and neutral terminals and auxiliary contacts, Bulletin 194Es share the same operating handles as the Bulletin 194L Control and Load Switches.
Bulletin 194E switches are offered in two mounting styles, Front/Door and Base/DIN configurations for a variety of installations. Switch body styles for Bulletin 194E base-mounted switches include standard interlock shaft; Bulletin 194E front-mounted switches include standard shaft. Two-position OFF-ON switch is used to connect or disconnect a variety of inductive loads, including solenoids, valves, magnetic starters, relays, and motors. Handles featuring marked legend plates are available in Selector-Knob, Disk-Style, Rectangular-Style and Key-Operated versions. Selector-Knob versions are available in three sizes. Most handles are available in colors of Grey/Black or Red/Yellow and have padlockable versions.

Bulletin 194E Open and Enclosed Switch Kits

Cat. No. Explanation

194E – Y 32 – 1753 – 6N

a b c d

a

Code	Installation Type
A	Base/DIN Mounting, open type switch
E	Front/Door Mounting, open type switch
Y	Enclosed Base Mounting Switch With Handle (Uses IP66 ABS thermoplastic enclosure)

b

Code	Load Size
16	16 A∗
25	25 A
32	32 A
40	40 A
63	63 A
80	80 A
100	100 A

c

Code	Configuration
1753	3-Pole OFF/ON (90°)
1756	6-Pole OFF/ON (90°)

d

Code	Handle Style
4N	194E-HE4N-175 (use with 16 A Switch)
4G	194E-HE4G-175 (use with 16 A Switch)
4A	194L-HE4A-175 (use with 16…100 A Switch)
6N	194L-HE6N-175 (use with 25…100 A Switch)
6G	194L-HE6G-175 (use with 25…100 A Switch)
6A	194L-HE6A-175 (use with 25…100 A Switch)

∗ For 16 A Enclosed Switch: use "16M" (3-pole enclosure has M16/20 knockouts, 6-pole 16 A enclosure has M25/32 knockouts). For 25/32 A Enclosed Switch with M20/25 metric knockouts: use “25M” or “32M”.

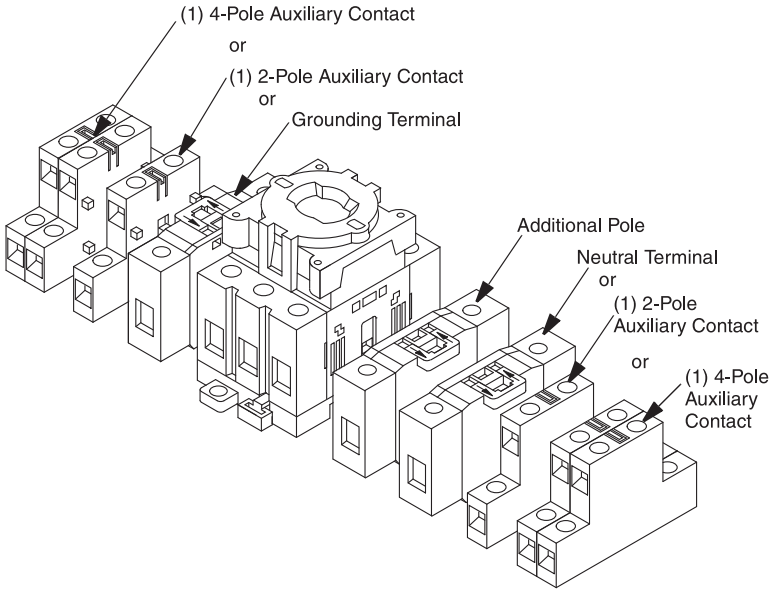
194E-A16...100 A, Base/DIN Rail Mounting



Accessory Configuration Guidelines

Accessory drawings represent modular, snap-on features of Bulletin 194E accessories. They are not suggesting possible accessory configurations. Use the following guidelines for choosing 194E accessory configurations.

- Up to two accessories may be added to the Bulletin 194E switch body.
- For the 194E 25, 32, 40, or 63 A switches, the early break auxiliary contact (-PD10) may only be used in the following configurations:
  As a single unit on either side of the switch
  As a single unit on a side when used with a switch + 4th pole (-NP)
  As a single unit on a side when used with a switch + ground terminal (-PE)
  As a single unit on a side when used with a switch + neutral terminal (-TN)
  No other auxiliary contact may be used in combinations with an early break auxiliary contact (-PD10)
- Other combinations of auxiliary contacts are permissable.
- For the 194E 80 and 100 A switches, any combination of auxiliary contacts, 4th pole, ground terminal, neutral terminal, and -PD10 is permissable.

Bulletin 194E IEC Load Switches

- At-Motor Disconnect Switch (UL508)
- 125, 160, 250, 315 A Versions of Inductive Load-Rated Switches
- IP66/UL Type 1/3/3R/12 Operating Handles
- IP2LX Finger-Safe Terminals
- 3- and 4-Pole Versions
- Front/Door or DIN/Base Mounting Configurations
- OFF-ON Configurations
- Box Lug and Bolt-on Terminals Available
- Switches Include Operating Shaft
- Suitable as Motor Disconnect

Bulletin 194E load switches are designed for use as local motor isolation and for disconnect switch applications. They are available in 3- and 4-pole versions with add-on grounding and neutral terminals and auxiliary contacts.
Bulletin 194E switches are offered in two mounting styles, Front/Door and Base/DIN configurations, for a variety of installations. Switch body styles for Bulletin 194E base-mounted switches include standard interlock shaft; Bulletin 194E front-mounted switches include standard shaft.

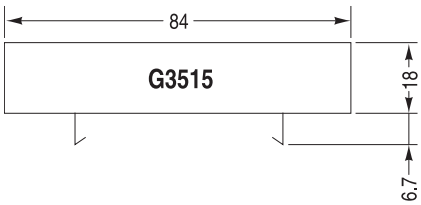
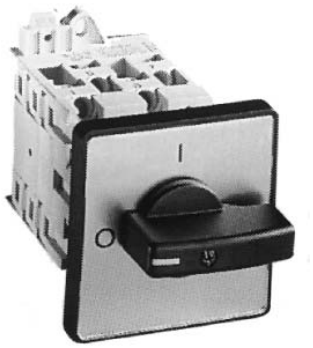
Additional Name Plate

Frame and legend snaps on to handle bezel. Fits size 8 and 13 handles.





Bulletin 194L IEC Control and Load Switches

- 12, 16, 20, 25, 32, and 40 A inductive load-rated switch
- IP66 water spray and dustproof handles
- IP20 finger-safe terminals
- Switches available for OFF-ON, changeover, star-delta (wye-delta), reversing, ammeter, voltmeter and step switch configurations
- 1…6-Pole versions
- Front/door- or base/ DIN Rail-mounting configurations
- Thermoplastic enclosures IP66
- Suitable as motor disconnect (UL 508)

Bulletin 194L control and load switches are flexible, adaptable, time- and space-saving devices. Switches are available as front/door- or Base/DIN rail-mounting versions. Uniformly styled handles, featuring marked legend plates, are available in Selector-Knob, Disk-Style, Rectangular-Style and Key-Operated versions. Selector-Knob versions are available in three sizes. Most handles are available in Grey/Black or Red/Yellow and have padlockable versions.

A new thermoplastic enclosure features constructions of impact-resistant ABS or corrosion resistant NORYL materials. Both shallow and deep versions include 35 mm DIN mounting rail, grounding and neutral terminals, and captive cover screws. Enclosures may be ordered with or without cover openings for handle mounting. Enclosures are rated for use in IP66 (UL Type 1, 3, 3R, 12) environments.

Product Overview

OFF-ON Switch

OFF-ON Switch

Two-position switch used to connect or disconnect a variety of inductive loads including: solenoids, handles, valves, magnetic starters and relays.

Ammeter Switch

Ammeter Switch

Multi-position switch used to connect one or more phases of an electrical supply to an ammeter, so that the current in each phase can be displayed on one ammeter.

Changeover Switch

Changeover Switch

Two-position switch used in control applications to change between alternate power supplies. This device can typically be used to manually switch power supplies from a primary source to a stand-by/emergency supply in the event of a power outage.

Voltmeter Switch

Voltmeter Switch

Multi-position switch used to connect two lines of the electrical supply system to a voltmeter so that the voltage between the lines (phase-to-phase or phase-to-neutral) can be displayed on one voltmeter.

Star-Delta (Wye-Delta) Switch

Star-Delta (Wye-Delta) Switch

Three-position (Off-Wye-Delta) switch used to manually control reduced-voltage motor starting. Operating the switch manually changes the wiring configuration of the motor from a star configuration to delta configuration after the controller operator has determined that the motor is up to operating speed.

Step Switch

Step Switch

Multi-position switch used to connect a variety of loads to an electrical supply in a pre-determined logical sequence. A typical application would be temperature control of a heating oven or furnace.

Reversing Switch

Reversing Switch

Three-phase, three-position (Forward-Off-Reverse) switch used to manually control a motor's direction of rotation. Operating the switch changes the wiring configuration of the motor to operate in the forward or reverse direction.

Custom Motor-Rated Cam Switches

Switch Specifications for Special Versions of Bulletin 194L Switches

Bulletin 194L switches are offered in 12, 16, 20, or 25 A load sizes. Switches may be configured for up to 16 inductive load 32 and 40 A rated circuits. Handle operation may be specified for up to 12 positions, with 30, 60, 45 or 90 degrees of positional rotation. Maintained and some spring return functions may be specified. Custom legend markings are also available.

Key Features

- Motor rated/HP rated to switch inductive loads
- Same appearance as standard 194L devices
- Suitable as Motor Disconnect
- Suitable for Across-the-Line motor starting applications
- Gold flashed contacts for Auxiliary load switching
- UL Listed, CSA Certified, CE compliant
- Lockout/Tagout compliant (when using lockable handles)
- Mounts to many competitive panel drilling patterns

Instructions to receive your price and availability quotation

- Complete the following layout form.
- Fill in distributor name, date, telephone/fax, quantity required and end user name. To locate your nearest Allen-Bradley distributor, go to www.ab.com.
- Select all the following options:
  Switch load size and mounting style
  Target table, # positions, spring returned/maintained operation
  Handle type
  Special wiring & terminal markings (optional)
- In the U.S. and Canada, send the completed Custom Switch form to your local Allen-Bradley distributor

If you are outside the US or Canada, or if you have technical questions about filling out this form, please call our Technical Response Center at 440-646-5800 and select the "Allen-Bradley Industrial Controls" option.

* When more than 4 modules are used, attach the first one to the switch body using the screws supplied with the extension **(Cat. No. 194L-G2853)**.
❄ With DIN 46 277 (35) Rail + 2.5 mm (7/64)
‡ For DIN Rail-mounted devices, remember to deduct the offset distance provided by the rail. For example, deduct 2.5 mm (7/64 in.) from the mounting depth for Bulletin 194L switch body mounted on DIN 46277 rail.
§ One 44 mm (1-47/64 in) end shaft is supplied with all Bulletin 194L Switch Bodies.

Dimensions are shown in millimeters (inches). Dimensions are not intended to be used for manufacturing purposes.

Bulletin 194R Next Generation Global Fused and Non-Fused Disconnects

- 20 A…63 A Sizes
- Fused switch versions:
  - BS88 - DIN
  - CSA HRCII-C - CSA HRCI-MISC
  - UL Class J - UL Class CC
  - NFC
- Non-fused switches
- Operating handle ingress ratings:
  - IP42 (Type 1)
  - IP66 (Type 3R, 3, 12, 4, 4X)
- Handle with or without test mode
- Padlockable handle for up to three padlocks
- Up to 6 auxiliary contacts can be added per switch
- Suitable as service entrance disconnecting means (UL 98)
- Suitable as at-motor disconnecting means (UL 508)

The Bulletin 194R line of fused and non-fused global disconnect switches provides the flexibility to meet worldwide applications. These rod-operated disconnect switches incorporate removable fuse carriers that have high short circuit protection ratings. The disconnect switches are UL Listed and CSA Certified and are designed to meet IEC 60947-3, VDE, DIN, BS and applicable NEMA requirements.

a b c d

a

Fuse Type	
Code	Description
C	UL Class CC, CSA Type HRCI-MISC (30 A)
J	UL Class J, CSA Type HRCI-J (30 A or 60 A)
H	CSA Type HRCII-C (30 A or 60 A)
B	BS88 (20 A, 32 A, or 63 A)
D	DIN (32 A or 63 A)
F	NFC (25 A, 32 A, or 63 A)
N	Non-fused (30 A or 60 A)

b

Load Size		
Code	Description	Dimensional Ref.
20	20 A (BS88)	A1
25	25 A (NFC)	A1
30	30 A (CC, J, HRCI-J)	A1
	30 A (Non-Fused) ❄	A2
	30 A (HRCII-C)	B1
32	32 A (BS88, NFC)	A1
	32 A (DIN)	B1
60	60 A (J, HRCI-J, HRCII-C)	B1
60	60 A (Non-Fused) ❄	B2
63	63 A (BS88, DIN, NFC)	B1

✶ See page 2-420 for dimensional reference data.
❄ Non-fused disconnect switches must use separately installed fuses for upstream short-circuit protection

c

No. of Poles	
Code	Description
1753	3-pole switch

d

Fuse Indication	
Code	Configuration
Blank	No fuse status indication
S	Fuse status indication

Limit of 6 total auxiliary contact blocks total for test and standard positions.
Fourth pole, additional auxiliary contacts and handle options available in accessory section.

OSHA Lockout/Tag Out Compliance (LOTO)

OSHA CFR36 Section 1910 mandates that disconnects be able to be locked out while in the OFF position during servicing. All Bulletin 194R handles comply with this important safety requirement.

(Please see NFPA Article 430 for disconnect requirements of motor applications)

Proper Selection of Disconnect Switches
Applications Within Canada and the United States

General

The requirements for disconnect switches used in motor branch circuits rated 600V and less are defined in Article 430, Part J of the U.S. National Electrical Code (NEC), NFPA70. Canadian Electrical Code (CEC) requirements are very similar in the area of motor branch circuit disconnect requirements. For simplicity, we will treat the NEC and CEC requirements as being the same — and reference specific sections of the U.S. National Electrical Code.
The requirements for properly sizing a disconnect switch are dependent on the type of application. The NEC refers to two types of applications: single motor and combination loads. A combination load consists of an application where two or more motors are used together or where one or more motors are used in combination with other loads, such as resistance heaters.

Single Motor Applications

Section 430-110 Paragraph (a) states that the disconnect switch must have an ampere rating of at least 115% of the full-load current rating of the motor.
Example 1: For a motor with a full-load current of 22 A, the disconnect switch must be rated at least 25.3 A (22 x 1.15).
If the disconnecting means under evaluation is rated in horsepower, the selection of the disconnect switch is even more straightforward; a disconnect switch must have a horsepower rating equal to, or greater than the horsepower rating of the motor at the applicable voltage.
Example 2: For a motor with a 10 Hp rating at 460V AC, the disconnect switch must be rated at least 10 Hp at 460V AC.
If the disconnect switch is rated in horsepower, and UL Listed, UL Component Recognized, or CSA Certified, it will meet the requirements for the 115% full load current rating stipulated by the NEC.

Combination Load Applications

Section 430-110 Paragraph (c) addresses the rating of the disconnecting means for combination loads. This paragraph essentially requires that the loads that "may be simultaneous on a single disconnecting means" be combined to provide equivalent full-load and locked-rotor currents for what is then to be considered as a single motor for the purpose of selecting the appropriate disconnecting means. This means that it is necessary to identify the particular combination of connected loads which can be operating simultaneously and will result in the maximum full-load and locked-rotor current sums.
The individual full-load current values are to be selected from Tables 430-148, 430-149, or 430-150 and the locked-rotor values are to be from Table 430-151.
The equivalent single motor full-load current is the sum of the simultaneously operating motor full-load currents and the rating in amperes of other loads operating at the same time. The equivalent locked-rotor current is the sum of the simultaneously started motors' locked-rotor currents and the full-load currents of the remaining operating motor and non-motor loads.
The disconnecting means shall have a current rating equal to or greater than 115% of the equivalent single motor full-load current and have a horsepower rating equal to or greater than the horsepower rating determined from the equivalent locked-rotor summation.
Consider the following 460V application:

Load	Hp	Full-Load Current [A]
Motor 1	5	7.6 (simultaneous)
Motor 2	10	14.0 (not included)∗
Motor 3	15	21.0 (simultaneous)
Motor 4	20	27.0 (simultaneous)
Other		7.0 (simultaneous)
Total Equivalent		62.6 (simultaneous)

∗ Motor 2 is not included in the total since it cannot operate simultaneously with the other motors, therefore, the disconnect switch must be rated at least 72 A (1.15 x 62.6).
Consider now the locked-rotor current analysis for the same application:

Load	Hp	Full-Load Current [A]
Motor 1	5	(7.6FLA) 45.6 (simultaneous)
Motor 2	10	84.0 (not included)∗
Motor 3	15	126.0 (simultaneous)❄
Motor 4	20	162.0 (simultaneous)❄
Other		7.0 (simultaneous)
Total Equivalent		302.6 (simultaneous)

∗ Note again that Motor 2 cannot operate simultaneously with the other loads.
❄ The largest equivalent locked-rotor current occurs when motors 3 and 4 start together while the other loads marked "simultaneous" are already operating. Since Motor 1 is not starting with Motors 3 and 4, its full-load current will be added to the total instead of its locked-rotor current.

Table 430-151, which provides the correlation between locked-rotor currents and Hp ratings, shows that a 40 Hp rating is the equivalent for 302.6 locked-rotor amperes.
Therefore, the disconnect selected for this application must have a current rating of at least 72 A and a Hp rating of at least 40 Hp. In this case a Bulletin 194R rated for 100 A and 60 Hp at 460V would be an appropriate choice. What can be seen from this analysis is that, depending upon the number of motors that can start simultaneously, the actual size of the required disconnect is sometimes determined by the equivalent full load current (72 A) and other times by the equivalent horsepower determined from the locked rotor analysis (40 Hp).

Applications Outside the United States and Canada

General

Disconnect switches designed to IEC Standards and used in applications outside of North America are selected based on the ampere, horsepower, or kilowatt rating of the disconnect switch, under various utilization categories. Utilization categories for disconnect switches are as follows:

Nature of Current	Utilization Category		Typical Applications
	Frequent Operation	Infrequent Operation	
AC	AC-20A∗	AC-20B∗	Connecting and disconnecting under no load conditions
	AC-21A	AC-21B	Switching of resistive loads including moderate overloads
	AC-22A	AC-22B	Switching of mixed resistive and inductive loads, including moderate overloads
	AC-23A	AC-23B	Switching of motor loads or other highly inductive loads

∗ The use of these utilization categories is not permitted in the U.S.

For any application, the disconnect switch rating (A. Hp, or kW) must be greater than or equal to the application full-load current or power (Hp or kW), in the appropriate utilization category.
Example 1: For a 380V 50 Hz distribution application (AC-22A), with a 63 A full load current, the disconnect switch must be rated at least 63 A at 380V 50 Hz for use in AC-22A applications.
Example 2: For a 415V 50 Hz motor application (AC-23A), with a 75 kW rating, the disconnect switch must be rated at least 75 kW at 415V 50 Hz for use in AC-23A applications.

Fuse Description

With Bulletin 194R Fused Disconnect Switches

Bulletin 194R Fused Disconnect Switches have been designed to accept a variety of fuses for worldwide application flexibility. Following is a brief summary of typical fuse specifications, where the fuses are typically used, and which Bulletin 194R disconnect switches will accommodate each fuse type. Fuse manufacturers should be contacted for more specific information about each fuse type. **Fuses are not available from Rockwell Automation. BS88 Fuses (63 A shown)**

Dimensions in millimeters (inches). Dimensions are not intended to be used for manufacturing purposes.

- IEC fuse type: Fuse-link for bolted connection
- Voltage rating: 660/690V AC
- Interrupting rating: 80 kA
- Standard cartridge sizes: A1, A2, A3, A4, B1, B2, B3, B4
- Typical ampere ratings: 2…400 A
- Construction: Blade type for bolted connection
- Can be installed on Bulletin 194R disconnect switch **Cat. Nos: 194RNA100P3, NA200P3, NA300P3, NA380P3, NA400P3, NB200P3, NB300P3**
- Where used: United Kingdom, Australia, New Zealand, Asia

LOVAG Certified

The Bulletin 194R line of fused and non-fused global disconnect switches provides the flexibility to meet worldwide applications. These rod-operated disconnect switches incorporate onboard fuse carriers thus reducing panel space requirements and have high short circuit protection ratings. The disconnect switches are UL Listed, CSA, ASTA and LOVAG Certified and are designed to meet IEC 60947-3, VDE, DIN, BS and applicable NEMA requirements.

Your order must include: 1) the desired disconnect switch Cat. No. Note the disconnect switch dimension reference, 2) the appropriate operating handle and operating shaft Cat. No. corresponding to the dimension reference of the disconnect switch, 3) if required, Cat. No. of any accessories.

Bulletin 194RS Preassembled Side-Mount Disconnect Switch

Bulletin 194RS NFPA 79 Compliant IEC Fused and Non-Fused Disconnects, Side-Mounted Style

- 30/60 A sizes
- Open switches
- Fused switch versions:
  – UL Class J, UL Class CC
- Non-fused switches
- Operating handle ingress ratings:
  – IP66 (Type 3R, 3, 12, 4, 4X)
- Pre-assembled, side-mounting bracketed disconnect interlock
- Padlockable handle

The Bulletin 194RS side-mount handle provides NFPA 79 compliancy with a bracketed switch and interlock system that is another Allen-Bradley exclusive. The 194R rotary handle is mounted to the side of the enclosure and attaches to the 194R bracketed disconnect and interlock mechanism. The side handle remains connected to the switch and interlock mechanism at all times. This solution provides the single, side handle design with the NFPA 79 compliancy of the secondary interlock.

IEC Fused and Non-Fused Disconnects

Overview/Catalog Number Explanation

Bulletin 194RC NFPA 79 Compliant IEC Fused and Non-Fused Disconnects with Cable-Operated Handle for Flange-Style Enclosures

- 30 A size
- Open switches
- Fused switch versions:
  - – UL Class J, UL Class CC
- Non-fused switches
- Uses Bulletin 1494F handles
  - – IP66 (Type 3R, 3, 12, 4, 4X)
- Pre-assembled cable-operated disconnect with interlock
- Padlockable handle mounts to flange-styled enclosures
- Cable options available in 3…10 ft. lengths
- NFPA 2002 Compliant

The Bulletin 194RC cable-operated disconnect with interlock is another Rockwell Automation Allen-Bradley exclusive, providing a fully compliant solution to the 2002 changes in the National Fire Protection Association 79 (NFPA 79).

The new 194RC combines the small size of the 194R IEC disconnect with the flexibility of a cable-operated mechanism to provide an NFPA 79 IEC solution for flange style enclosures. The 194RC bracketed mechanism for 194R 30 A devices attaches to the current 194R disconnect switch base and operates the ON-OFF action via cable to a standard 1494F handle.

The 194RC handle/interlock mechanism provides the 'no-tools' operation and the secondary interlock as required by NFPA 79 2002 changes. The 194RC cable-operated disconnect is offered in 3…10 ft cable lengths, allowing a variety of placement options for the 194R disconnect within the enclosure. The handle is available in 3 different styles: plastic, stainless steel, or painted metal.

Bulletin 194RC Installation

1. Install disconnect switch with four #10-32 screws (see ***Figure 1***).

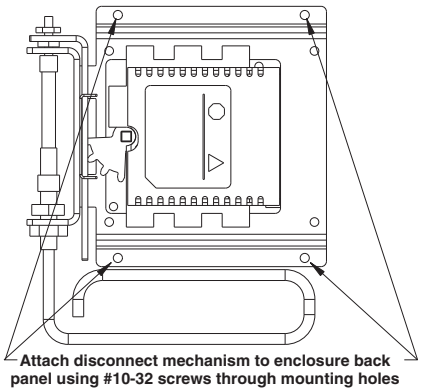

Figure 1 *Attaching Disconnect to Enclosure Back Panel*

2. Install handle to enclosure by placing the outer handle mechanism with the attached gasket over the enclosure cutout. Insert the top mounting screw with lockwasher through the enclosure and thread it into the outer handle mechanism for a few turns but not all the way (see ***Figure 2***).
3. Slide the toggle mechanism assembly over the top handle mounting screw. Insert the bottom handle mounting screw and lockwasher through the toggle mechanism assembly, through the enclosure and into the handle. Tighten both mounting screws to specified torque (see ***Figure 2***).
4. Assemble adapter link to actuator link. Tighten to specified torque (see ***Figure 3***).
5. Align adapter link with the bell crank. Attach bell crank to adapter link with shoulder bolt and nut. Tighten to specified torque (see ***Figure 4***).
6. Mount door hasp to handle using the two screws provided with the handle (see ***Figure 2***).
7. Operate handle mechanism to ensure functionality. To operate either close door or defeat door interlock.
8. If minor adjustments are necessary, refer to adjustment checklist (page 2-450).
9. Install appropriate door hardware (supplied).

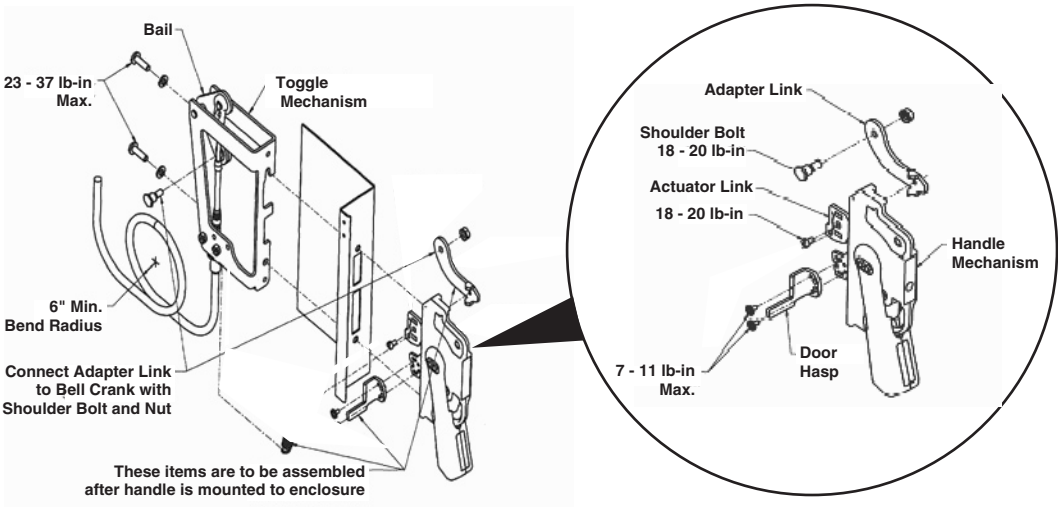

Figure 2 *Securing Toggle Mechanism and Handle to Flange*

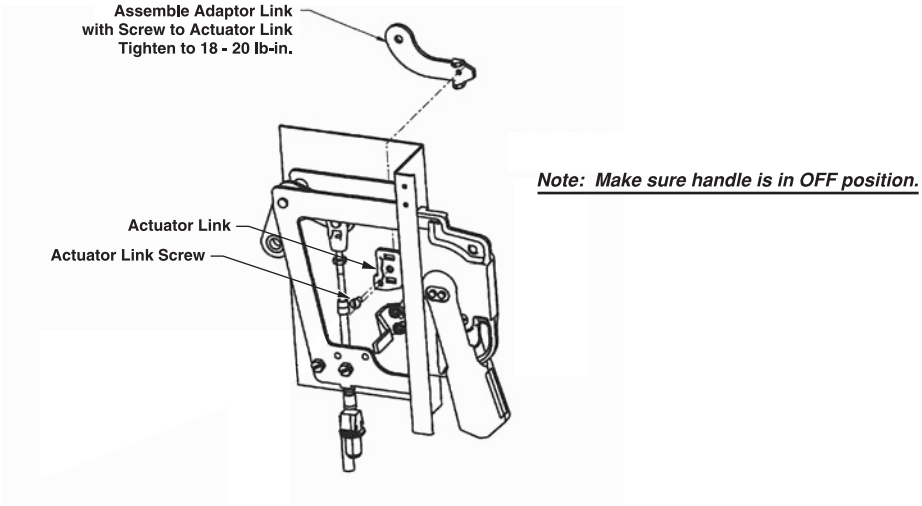

Figure 3 *Assembly of Adapter Link to Actuator Link*

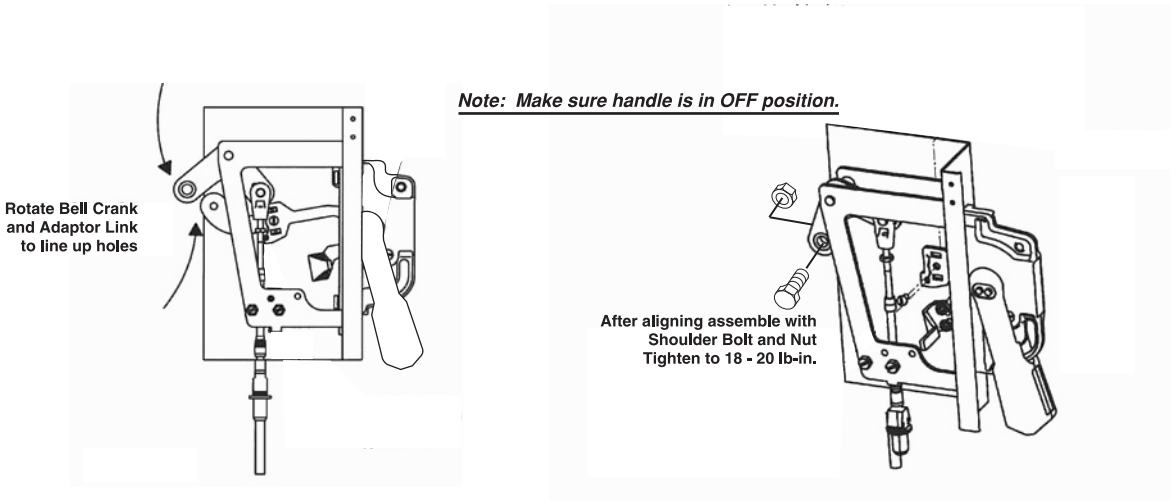

Figure 4 *Assembly of Adapter Link to Bell Crank Using Shoulder Bolt*

ATTENTION

Before any installation or maintenance is performed, make sure that the disconnect switch is not energized.

Adjustment Checklist

Situation:
Handle and Cable Operated Mechanism turns **ON**, but disconnect switch does not transition to **ON**.

Adjustment:
Loosen the lifting washer/nut while tightening the washer/lockwasher/nut, two or three turns should be sufficient (see ***Figure 5***).

➲ **NOTICE**
Check the OFF position of the actuator mechanism, that the lifting nut and sleeve of cable do not come into contact with the bulkhead connector (***Figure 5***). If they do, move the bulkhead connectors accordingly.

Situation:
Handle and Cable Operated Mechanism turns **OFF**, but disconnect switch does not transition to **OFF**.

Adjustment:
For the Cable Operated Disconnect Mechanism, loosen the washer/lockwasher/nut until the Disconnect Switch turns **OFF** with positive action. Tighten both nuts and recheck for **ON** and **OFF** positions (***Figure 5***).

NOTICE
Be certain after adjustment to have a minimum of 1 thread past the washer/lockwasher/nut assembly (***Figure 5***). If any other adjustment problems should arise, contact your local Allen-Bradley representative.

To obtain a complete Rotary Circuit Breaker Operating Mechanism, order the following:

Rotary Circuit Breaker Operating Mechanism (Circuit Breaker is shown but not supplied with Operating Mechanisms)

Operating Shaft

Operating Handle

Bulletin 198-H Rotary Circuit Breaker Operating Mechanisms

- Rotary circuit breaker operating mechanisms available up to 400 A
- Adaptable to enclosures:
  - IP42 (Type 1)
  - IP66 (Type 3, 3R, 4, 4X, 12)
- Color coded on/off/reset handle indication

The Bulletin 198-H Rotary Circuit Breaker Operating Mechanism permits door-mounted, rotary-operated circuit breaker disconnection of motor loads using Bulletin 190 Disconnect Handles and Cutler-Hammer/Westinghouse G and H frame motor protectors in industrial applications. Operating handles are adaptable to IP42 (Type 1) and IP66 (Type 3, 3R, 4, 4X, 12) enclosures for door-mounted operation. A complete installation consists of operating mechanism, operating handle, operating shaft, plus ***user-supplied circuit breaker and enclosure.***

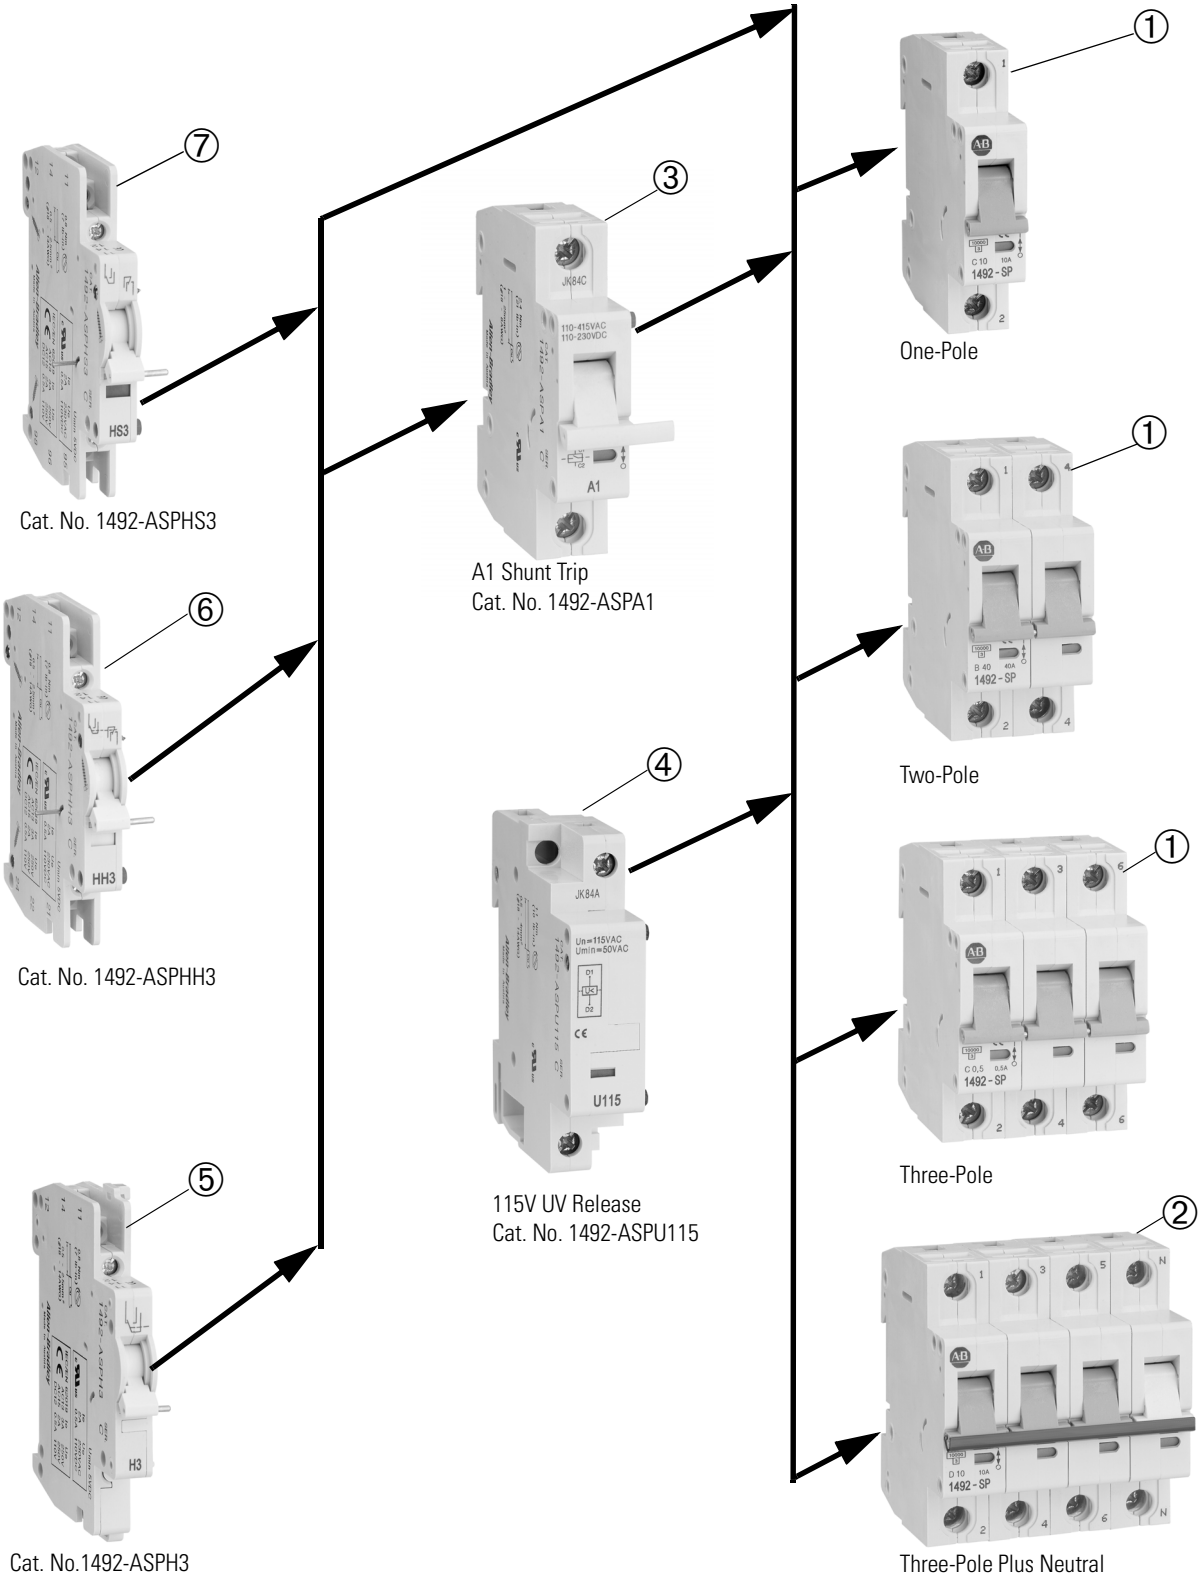
Rockwell Automation

Bulletin 1492-SP Supplementary Protectors and Accessories



Introduction

① Supplementary Protector/ Miniature Circuit Breaker

- Available in single or multi-pole. Meets UL 1077/CSA 22.2 No. 235. In conformity with IEC/EN 60 898. CE Marked

  B-trip: Trip Characteristic for resistive or slightly inductive loads
  C-trip: Trip Characteristic for inductive loads
  D-trip Trip Characteristic for highly inductive loads ❶

  ❶ UL/CSA pending.

② Switched Neutral Protector (Not Field Mountable)

- Switched neutral pole closes before the adjacent protected pole (i.e. early make)
- Instantaneous/magnetic release provided but no overload thermal release

③ Shunt Trip

- Field installable
- Mounts to side
- Module width is equal to that of a single pole

④ Undervoltage Release

- Field installable
- Mounts to side
- Module width is equal to that of a single pole

⑤ Auxiliary Contact Module

- Field installable
- Changeover contact
- Switches when protective device is operated manually or is tripped electrically
- 1 Form C

⑥ Dual Auxiliary Contact Module

- Field installable
- (2) auxiliary contacts
- Changeover contact
- Switches when protective device is operated manually or is tripped electrically
- 2 Form C

⑦ Auxiliary/Signal Alarm

- Field installable
- Auxiliary contacts

  Auxiliary Contact switches when protective device is operated manually or is tripped electrically
- Signal alarm

  Signal alarm contact switches only when protective device is tripped electrically
- Changeover contact
- 2 Form C
- Front indicator indicates when device is tripped electrically

Description

Bulletin 1492 "Energy Limiting" devices are thermal magnetic type overcurrent protective devices meeting UL 1077/CSA 22.2 No. 235, IEC/EN 60898 and IEC 947-2. These devices are designed for the protection of a wide variety of products including:

- Solenoids
- Test Equipment
- Controller I/O Points
- Relay and Contractor Coils
- Computers
- Transformers
- Automotive Systems
- Power Supplies
- Medical Equipment
- Control Instrumentation

The Bulletin 1492-SP supplementary protectors/miniature circuit breakers are available in one-, one-pole plus neutral, two-, three-, and three-pole plus neutral units. One- and two- pole AC units also have limited DC ratings. Two and three pole units are connected at the handle for simultaneous operation.

Screw termination is standard on all 1492-SP units. Both line and load side terminals accept #16…4 AWG (1.5…25 mm^2) copper wire.

Important: UL 1077, CSA C22.2 No. 235– In North America, miniature circuit breakers are recognized as supplementary protectors and are intended for use as overcurrent protection within an appliance or other electrical equipment where branch circuit protection is already provided or not required. Internationally, these products are rated to IEC standards as miniature circuit breakers for equipment.

International Approvals

The Bulletin 1492-SP supplementary protectors/miniature circuit breakers are designed to comply with standards for world-wide customer acceptance. They meet the following standards:

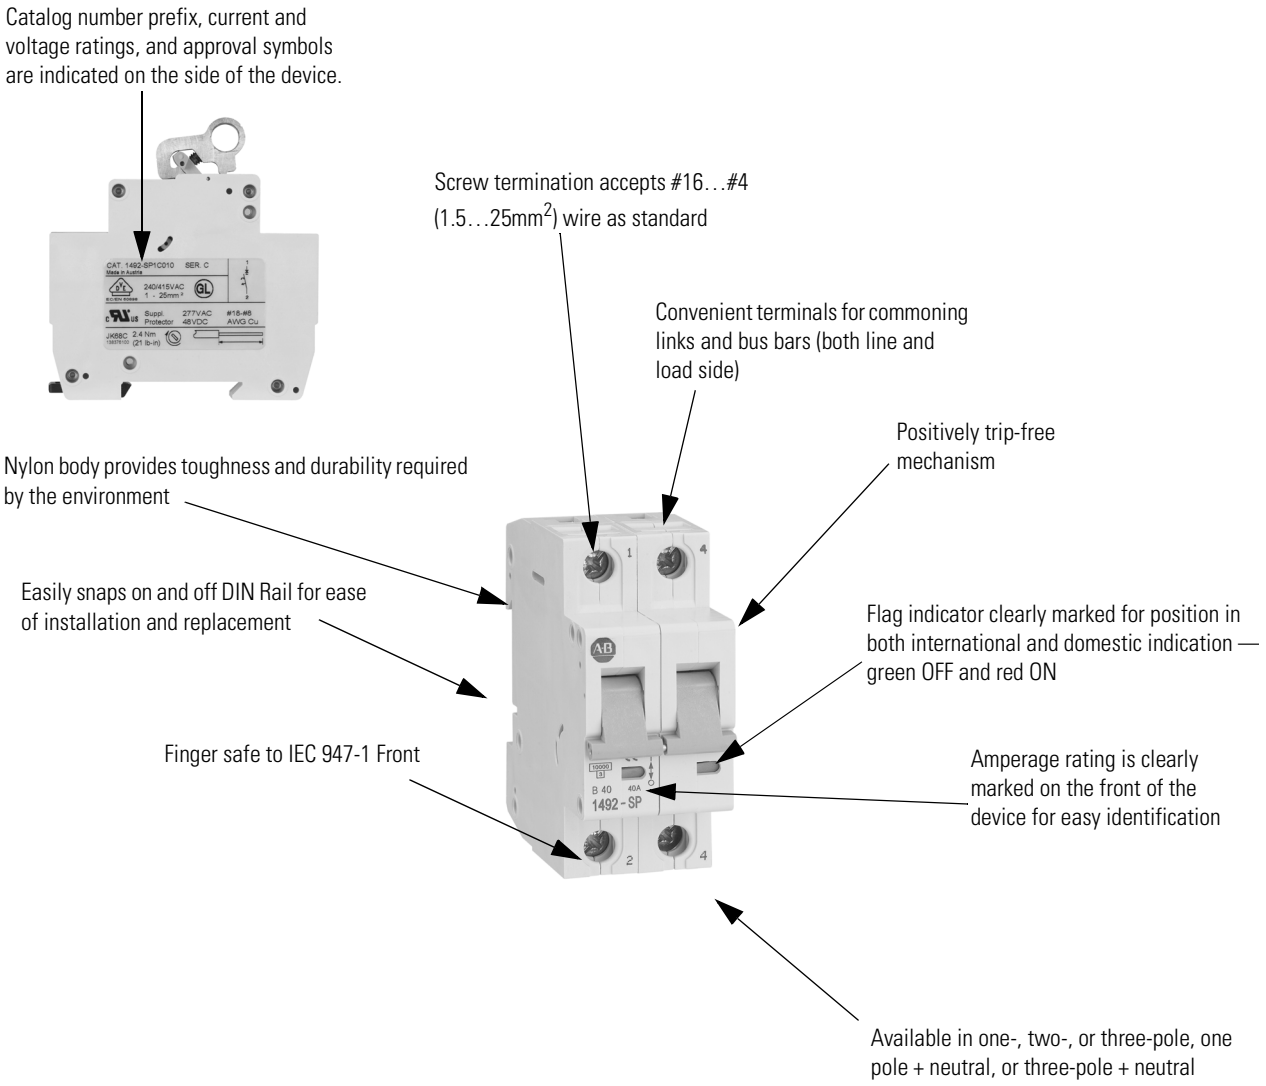
Certifying Agency	Certification Marks	Country	Standard
Underwriters Laboratory	c UL us	USA	UL 1077
		Canada	CSA 22.2 No. 235
Verband Deutscher Electrotechniker	DVE	Germany	IEC/EN 60 898
Germanischer Lloyd	GL	Germany	IEC/EN 60 947-2
per Conformite European	CE	European Union	LVD Directives
per International Electrotechnical Commission	IEC	Global	IEC 60 898 IEC 60 947-2

Features

- Energy Limiting Design—protects downstream components better than conventional breakers during short circuits
- Field mountable options for selective applications
- True IP2X finger safe design (front)
- International approvals—CE Marked, and meets UL, CSA, and IEC (VDE, GL) standards for worldwide acceptance
- Ratings to 480Y/277V AC
  @ 240/415V AC — 10,000 A Interrupt Rating
- AC and DC voltage ratings—in one convenient device
- A positively trip-free mechanism (breaker operation cannot be defeated by holding the handle in the ON position)
- 3 trip curves: B, C, and D
- Time delay (D characteristic) for high inrush currents during inductive start-ups such as transformers and power supplies
- Superior shock and vibration resistance capabilities—helps to prevent nuisance tripping
- Mounts on DIN Rail
- Line and load connections may be reversed

Construction

The following design features provide superior performance



Switched Neutral Module (Not Field Mountable)

The switched neutral module opens the neutral line of the circuit when the protected poles are tripped. Use this module as a safety measure (required by some standards) when protecting networks with a grounded neutral system. The switched neutral pole closes before the adjacent protected pole (i.e. early make). Provided with instantaneous/magnetic trip. Manual actuation is through the linked handles.

Switched neutral modules are always mounted on the right side of the protected poles. These modules are not field installable.

How to Order

Ordering Information

To order the proper device, you need to know:

- Maximum rated current of equipment to be protected
- 1-, 2-, or 3- phase system
- Maximum startup (inrush) current
